

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

PREFACE.

THIS edition is intended for teachers, *and for them only*. The publishers will make every effort to keep the book from pupils; and teachers are urged to exercise the utmost care not to lose their copies, or to leave them where pupils can have access to them.

It is hoped that young teachers will derive great advantage from studying the systematic arrangement of the algebraic work, for such attention has been paid to this as the limitation of the page would allow.

It is also expected that many teachers, who are pressed for time, will find great relief by not being obliged to work out every problem in the Algebra.

Exercise 18. Page 44.

Reduce to a single expression :

1. $(16 - 11 + 2) \times 5 = 7 \times 5 = 35.$
2. $(4 \times 15) \div (2 \times 3) = 60 \div 6 = 10.$
3. $(84 \div 7) + (4 + 5 - 6) = 12 + 3 = 15.$
4. $(44 - 31) \times (14 - 11) = 13 \times 3 = 39.$
5. $(96 \div 6 + 5) - (6 \times 8 \div 16) = 21 - 3 = 18.$
6. $(52 - 5 \times 7) + (4 \times 5) - 16 \div 2 = 17 + 20 - 8 = 29.$
7. $52 - 5 \times 7 + 4 \times 5 - 16 \div 2 = 52 - 35 + 20 - 8 = 29.$
8. $(62 + 3 - 15) \div 10 + (6 \times 7 - 30) \div 3 = 50 \div 10 + 12 \div 3$
 $= 5 + 4 = 9.$

Exercise 19. Page 45.

By the use of reciprocals, find the value of :

1. $8 \times 0.25 = 8 \div 4 = 2.$
2. $171 \div 0.25 = 171 \times 4 = 684.$
3. $876 \times 1.25 = 876 \div 0.8 = 8760 \div 8 = 1095.$
4. $132 \times 2.5 = 132 \div 0.4 = 1320 \div 4 = 330.$
5. $591 \div 2.5 = 591 \times 0.4 = 236.4.$
6. $756 \div 0.125 = 756 \times 8 = 6048.$
7. $268 \times 25 = 268 \div 0.04 = 26,800 \div 4 = 6700.$
8. $753 \div 25 = 753 \times 0.04 = 30.12.$
9. $567 \div 625 = (567 \div 5) \times 0.008 = 113.4 \times 0.008 = 0.9072.$
10. $1764 \times 0.025 = 1764 \div 40 = 44.1.$
11. $5381 \div 0.025 = 5381 \times 40 = 215,240.$
12. $7452 \div 0.875 = 7452 \times 8 \div 7 = 59,616 \div 7 = 8516.6.$
13. $651 \times 0.33333 = 651 \div 3 = 217.$

Express the value of :

1. $10^1 = 10.$

$10^2 = 10 \times 10 = 100.$

$10^3 = 10 \times 10 \times 10 = 1000.$

$10^4 = 10 \times 10 \times 10 \times 10 = 10,000.$

$10^5 = 10 \times 10 \times 10 \times 10 \times 10 = 100,000.$

$10^6 = 10 \times 10 \times 10 \times 10 \times 10 \times 10 = 1,000,000.$

$10^7 = 10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10 = 10,000,000.$

$10^8 = 10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10 \times 10 = 100,000,000.$

$$2. 10^3 \div 10^2 = 10^{3-2} = 10.$$

$$10^8 \div 10^5 = 10^{8-5} = 10^3.$$

$$10^6 \div 10^3 = \frac{1}{10^{3-6}} = \frac{1}{10^3}.$$

$$10^9 \div 10^4 = 10^{9-4} = 10^5.$$

$$3. 9.99^4 \div 9.99^2 = 9.99^{4-2} = 9.99^2.$$

$$9.99^{108} \div 9.99^{110} = \frac{1}{9.99^{110-108}} = \frac{1}{9.99^2}.$$

$$9.99^{16} \div 9.99^{18} = \frac{1}{9.99^{18-16}} = \frac{1}{9.99^2}.$$

$$4. 1.01^{25} \div 1.01^{22} = 1.01^{25-22} = 1.01^3.$$

$$1.01^{12} \div 1.01^{15} = \frac{1}{1.01^{15-12}} = \frac{1}{1.01^3}.$$

$$1.01^{19} \div 1.01^{16} = 1.01^{19-16} = 1.01^3.$$

Exercise 35. Page 81.

1. If a stone weighs 1.3^{kg} in air and 0.68^{kg} in water, and the stone and a block of wood together weigh 1.55^{kg} in air and 0.63^{kg} in water, what is the specific gravity of the block of wood?

$$1.55 \text{ kg} - 1.3 \text{ kg} = 0.25 \text{ kg, the weight of the wood in the air.}$$

$1.55\text{kg} - 0.63\text{kg} = 0.92\text{kg}$, the weight of the water displaced by the stone and the wood.

$1.3\text{kg} - 0.68\text{kg} = 0.62\text{kg}$, the weight of the water displaced by the stone alone.

Therefore, $0.92\text{kg} - 0.62\text{kg} = 0.3\text{kg}$, the weight of the water displaced by the wood.

$0.25 \div 0.3 = 0.833$, the specific gravity of the wood.

Volume of the block is $(1.6 \times 0.3 \times 0.15)$ cbm.

Volume of the water displaced is $(1.6 \times 0.3 \times 0.12)$ cbm.

Weight of the water displaced is $(1.6 \times 0.3 \times 0.12)^t$.

Weight of the block is $(1.6 \times 0.3 \times 0.12)^t$.

Therefore, the specific gravity of the wood

There are 11 hours between 11 A.M. and 10 P.M.

The ratio of the distance on the globe between the two cities to the equator is $0.046^{\text{m}} \div 0.80^{\text{m}} = 0.0575$. Therefore the actual distance between the two cities is $0.0575 \times 40,075.45^{\text{km}} = 2304.338^{\text{km}}$. *Ans.*

$$45^{\text{mm}} = 0.045^{\text{m}}. \quad 24^{\text{mm}} = 0.024^{\text{m}}.$$

The volume of the bar is $(0.045 \times 0.045 \times 3)^{\text{cbm}} = 0.006075^{\text{cbm}}$. The area of the end, after the bar has been heated, is

The volume of the box is $(3.75 \times 3.50 \times 0.50)^{cbm} = 6.5625^{cbm}$. Since 1^{cbm} of mortar when slaked becomes 1.8^{cbm} , the box will hold 6.5625^{cbm} of slaked mortar, which is the same as $6.5625^{cbm} \div 1.8 = 3.646^{cbm}$ of dry mortar.

The volume of a cake of soap is $(13 \times 13 \times 29)^{ccm} = 4901^{ccm}$. The volume of the chest, deducting waste of room in packing, is

$$0.88 \times (1.17 \times 0.90 \times 1.04)^{cbm} = 0.9637056^{cbm} = 963,705.6^{ccm}.$$

The weight of the water displaced by the body is 5^{kg}.

\$ 7.00 per 100^{kg} is the same as \$ 0.07 per kilogram. 64. The fine coal which collects about the shafts of the mines and in the coal yards, was for a long time wasted, because it could not be burned in stoves and grates. Now this dust is mixed with tar in proportion of 92^{ks} of dust and 8^{ks} of tar; the mixture is heated, and afterwards pressed in rectangular moulds 14.75^{cm}, by 18.5^{cm}, by 29^{cm}; each one of these blocks weighs 10^{ks}. They are sold at \$3.00 a ton, and make excellent fuel for heating steam boilers. Find the specific gravity of this fuel; also, the sum which would be realized in thus utilizing 800,000^t of coal dust, the cost of tar, mixing, etc., being \$0.50 a ton.

Volume of a block is $(14.75 \times 18.5 \times 29)^{ccm} = 7913.375^{ccm} = 7.913375^l$. Specific gravity is $10 \div 7.913375 = 1.264$. 800,000^t of coal dust will make $800,000^t \div 0.92 = 869,565.217^t$ of the mixture. 869,565.217^t at \$2.50 per ton = $869,565.217 \times \$2.50 = \$2,173,913.04$. *Ans.*

66. Fifty-three kilograms of starch are obtained from 100^{kg} of wheat. A hektar of land produces 1363 of wheat; a hektoliter of wheat weighs 78^{kg}. If the wheat harvested from a field measuring 2^{ha} and 33^{qm} is taken

to a starch factory, how much starch will be made from it?

0.53^{kg} of starch is obtained from 1^{kg} of wheat. 1^l of wheat weighs 0.78^{kg}. 1^{ha} produces 1363 \times 0.78^{kg} of wheat = 1063.14^{kg}. 2^{ha} 33^{qm} = 2.0033^{ha}. 2.0033^{ha} produces $2.0033 \times 1063.14^{\text{kg}} = 2129.788362^{\text{kg}}$ of wheat. The amount of starch is

67. A gardener wishes to provide glass for his hotbeds. The beds cover 2.65^a; the panes will cover 0.75 of the whole surface, the rest being taken up by the frames and alleys. First, find how many panes measuring 45^{cm} by 37^{cm} it will take to cover the beds; then find the price of the glass, at a cost of 95 cents a square meter.

$$45^{\text{cm}} = 0.45^{\text{m}}; 37^{\text{cm}} = 0.37^{\text{m}}; 2.65^{\text{a}} = 265^{\text{qm}}.$$

Total area of the glass is 0.75 of $265^{\text{qm}} = 198.75^{\text{qm}}$. The area of one pane is $(0.45 \times 0.37)^{\text{qm}} = 0.1665^{\text{qm}}$. Therefore the number of panes needed is $198.75 \div 0.1665 = 1194$. At $\$0.95$ per square meter, 198.75^{qm} will cost $198.75 \times \$0.95 = \188.81 .

68. A jar full of water weighs 1.325^{kg} ; filled with mercury it weighs 12.540^{kg} . Find the capacity and the weight of the jar, if the specific gravity of the mercury is 13.59 .

The weight of the jar and the jar full of mercury is 12.540^{kg} . The weight of the jar and the jar full of water is 1.325^{kg} . Therefore the difference in weight between the mercury and the water is $12.540^{\text{kg}} - 1.325^{\text{kg}} = 11.215^{\text{kg}}$. $13.59 - 1 = 12.59$, the specific gravity of a liquid of which the jar full without the jar weighs 11.215^{kg} . Hence the capacity of the jar is $(11.215 \div 12.59)^{\text{l}} = 0.89078^{\text{l}}$. 0.89078^{l} of water weighs 0.89078^{kg} . Find the weight of the gas used in a month of 26 days, and the expense of lighting the shop, when gas costs 6 cents a cubic meter.

1^{l} of gas weighs $0.97 \times 1.293^{\text{g}} = 1.25421^{\text{g}}$. 65 jets, each burning 123^{l} an hour, and used 5 hours an evening for 26 days, will use $65 \times 5 \times 26 \times 123^{\text{l}} = 1,039,350^{\text{l}}$, the weight of which is $1,039,350 \times 1.25421^{\text{g}} = 1,303,563.16^{\text{g}} = 1303.563^{\text{kg}}$. $1,039,350^{\text{l}} = 1039.35^{\text{cbm}}$. 73. Hewn stone of medium durability ought not to support, as a permanent weight, more than 0.07 of the weight that is required to crush it. A certain kind of stone used for building will be crushed

250^{kg} per square centimeter is equivalent to 250,000^g per square centimeter. 0.07 of 250,000^g = 17,500^g ought to be the pressure on a square centimeter. 75. A farmer wishes to drain a field of 8.75^{ha}. Each hektar requires 750^m of ditches. The opening of these ditches costs 10 cents a running meter; the tiles are 30^{cm} long, and cost \$15 a thousand. He pays 2 cents a meter for laying the tiles, and 4 cents a meter for filling the ditches. What is the cost of draining the field?

There are required $8.75 \times 750^m = 6562.5^m$ of ditches. The expense of opening the ditches, laying the tiles, and filling the ditches is $\$0.10 + \$0.02 + \$0.04 = \0.16 per meter. 6562.5^m will cost $6562.5 \times \$0.16 = \1050.00 . $30^{cm} = 0.3^m$. For 6562.5^m , $6562.5 \div 0.3 = 21,875$ tiles are necessary. The tiles cost $\$15$ per thousand. Therefore 21.875 thousand cost $21.875 \times \$15 = \328.13 . $$84\frac{1}{2} + 19\frac{1}{4} + \frac{4}{5} = 103\frac{1865 + 1100 + 1722}{2100} = 103\frac{4687}{2100} = 104\frac{993809}{2100} = 104.993809\frac{1}{4}.$$

$$84\frac{1}{2} + 19\frac{1}{4} + \frac{4}{5} = 84.5 + 19.25 + 0.8 = 104.55 = 104.55.$$

$$3\frac{5}{8} + 2\frac{1}{2} = 3.625 + 2.5 = 6.125.$$

8. $7\frac{3}{8} - 4\frac{5}{8}$.

$$7\frac{3}{8} - 4\frac{5}{8} = \frac{316-25}{40} = 2\frac{11}{8} = 2.775.$$

9. $82\frac{1}{8} - 37\frac{1}{8}$.

$$82\frac{1}{8} - 37\frac{1}{8} = \frac{4516-55}{80} = 44\frac{11}{80} = 44.5125.$$

$$82\frac{1}{8} - 37\frac{1}{8} = 82.2 - 37.6875 = 44.5125.$$

10. $100 - 17\frac{1}{8}$.

$$100 - 17\frac{1}{8} = 82\frac{7}{8} = 82.8192.$$

$$5\frac{1}{2} - 1\frac{1}{2} \times 1\frac{1}{2} = 5.5 - 1.5 \times 1.5416\bar{6} = 5.5 - 2.3125 = 3.1875.$$

12. $\frac{1}{3} - \frac{1}{4}$.

$$\frac{1}{3} - \frac{1}{4} = \frac{896-275}{1600} = \frac{621}{1600} = 0.388125.$$

$$\frac{1}{3} - \frac{1}{4} = 0.56 - 0.171875 = 0.388125.$$

13. $8\frac{1}{2} - 1\frac{1}{2}$ of $\frac{3}{16}$.

$$8\frac{1}{2} - 1\frac{1}{2} \times \frac{3}{16} = 8\frac{1}{2} - \frac{9}{32} = 8\frac{16-9}{32} = 7\frac{7}{32} = 7.91875.$$

$$8\frac{1}{2} - 1\frac{1}{2} \times \frac{3}{16} = 8.2 - 1.5 \times 0.1875 = 8.2 - 0.28125 = 7.91875.$$

14. $\frac{1}{4} \times 1000$.

$$\frac{1}{4} \times 1000 = \frac{2575}{8} = 296\frac{7}{8} = 296.875.$$

$$\frac{1}{4} \times 1000 = 0.296875 \times 1000 = 296.875.$$

10. In a certain school $\frac{2}{3}$ of the scholars are girls, $\frac{1}{3}$ of the boys are over 16 years old, and $\frac{1}{3}$ boys are under 16. How many girls and how many scholars are there in the school?

Since $\frac{2}{3}$ of the scholars are girls, $\frac{1}{3}$ are boys. Since $\frac{1}{3}$ of the boys are over 16 yrs. old, $\frac{1}{9}$ of the boys are under 16; that is, $\frac{1}{9}$ of $\frac{1}{3} = \frac{1}{27}$ of the scholars.

Therefore, $\frac{1}{27}$ is $\frac{1}{27}$ of the number of scholars.

$$9 - \frac{3}{16} = \frac{16}{3} \times \frac{3}{2} = 22$$

$$\frac{9}{16} \times \frac{2}{22} = 18.$$

11. In a certain school $\frac{1}{3}$ of the scholars are boys; $\frac{1}{3}$ of the girls are under 16, and 13 girls are over 16. How many boys and how many girls are there in the school?

Since $\frac{1}{3}$ of the scholars are boys, $\frac{2}{3}$ are girls. Since $\frac{1}{3}$ of the girls are under 16, $\frac{1}{9}$ of the girls are over 16, that is,

$$\frac{13}{22} \text{ of } \frac{11}{24} = \frac{13}{48} \text{ of the scholars.}$$

Therefore, 13 is $\frac{13}{48}$ of the number of scholars.

$$13 = \frac{13}{48} = \frac{48}{13} \times 13 = 48.$$

Hence, the number of boys is $\frac{13}{24}$ of 48 = 26. Ans.

Hence, the number of girls is $\frac{11}{24}$ of 48 = 22. Ans.

12. If from a certain number $\frac{1}{4}$ of it is subtracted, then $\frac{1}{3}$ of the remainder, then $\frac{1}{5}$ of that remainder, 6 still remains. What is the number?

After $\frac{1}{4}$ of the number is subtracted $\frac{3}{4}$ is left.

After $\frac{1}{3}$ of $\frac{3}{4}$ is subtracted $\frac{2}{3}$ of $\frac{3}{4} = \frac{1}{2}$ is left.

After $\frac{1}{5}$ of $\frac{1}{2}$ is subtracted $\frac{4}{5}$ of $\frac{1}{2} = \frac{2}{5}$ is left.

$$\text{Therefore, the number} = 6 \div \frac{2}{5} = \frac{35}{2} \times 2 = 35. \text{ Ans.}$$

$$\frac{7}{9} \text{ of } \frac{2}{5} = \frac{7}{15}. \quad \frac{7}{15} \text{ of } \$45,000 = \$21,000, \text{ A's. Ans.}$$

$$3\frac{1}{4} \text{ of } \frac{2}{9} \text{ of } \$21,000 = \frac{14}{9} \times \frac{2}{9} \times \$21,000 = \$15,000, \text{ B's. Ans.}$$

$$\frac{5}{12} + \frac{1}{4} + \frac{1}{6} + \frac{1}{8} = \frac{10 + 6 + 4 + 3}{24} = \frac{23}{24}.$$

Therefore, \$550 is $\frac{1}{24}$ of the property.

$$\text{Lateral area} = (20 \times 3.1416 \times 18) \text{ sq. ft.} = 1130.976 \text{ sq. ft.}$$

$$\text{Area of bottom} = 3.1416 \times (9 \times 9) \text{ sq. ft.} = 254.4696 \text{ sq. ft.}$$

39. The diameters of two right cylinders of the same height are as 6 to 1. Compare the lateral surfaces.

$$\frac{\text{Lateral area of larger}}{\text{Lateral area of smaller}} = \frac{\text{height} \times 3.1416 \times 6}{\text{height} \times 3.1416 \times 1} = \frac{6}{1}$$

That is, the lateral areas are as 6 to 1.

Exercise 89. Page 186.

1. How many yards of carpeting 27 in. wide will be required for a floor 26 ft. long, $15\frac{1}{4}$ ft. wide, if the strips run lengthwise? How many if the strips run across the room? How much will be turned under in each case?

$$27 \text{ in.} = 2\frac{1}{4} \text{ ft.} \qquad 15\frac{1}{4} \div 2\frac{1}{4} = \frac{4}{9} \times \frac{63}{4} = 7.$$

Hence 7 strips will be required.

$$7 \times 26 \text{ ft.} = 182 \text{ ft.} = 60\frac{2}{3} \text{ yd. Ans.}$$

$$26 \div 2\frac{1}{4} = \frac{4}{9} \times 26 = \frac{104}{9} = 11\frac{5}{9}.$$

Hence 12 strips will be required.

$$12 \times 15\frac{1}{4} \text{ ft.} = 12 \times 5\frac{1}{4} \text{ yd.} = 63 \text{ yd. Ans.}$$

In the first case nothing will be turned under; in the second a strip $\frac{4}{9}$ of 86 in. = ~~16~~ in. wide.

12

2. How many yards of carpeting $\frac{7}{8}$ yd. wide will be required for a room $8\frac{1}{2}$ yd. by 17 ft., if the strips run lengthwise, and if there is a waste of $\frac{1}{8}$ yd. a strip?

$$17 \text{ ft.} = 5\frac{1}{2} \text{ yd.} \qquad 5\frac{1}{2} \div \frac{7}{8} = \frac{8}{7} \times \frac{17}{3} = \frac{136}{21} = 6\frac{1}{3}.$$

Hence 7 strips will be required.

$$8\frac{1}{2} \text{ yd.} + \frac{1}{8} \text{ yd.} = 8\frac{9}{8} \text{ yd.} \qquad 7 \times 8\frac{9}{8} \text{ yd.} = 59\frac{1}{2} \text{ yd.} \text{ Ans.}$$

3. How many square yards of oilcloth will be required for a hall floor $5\frac{1}{2}$ yd. long and 10 ft. wide?

$$10 \text{ ft.} = 3\frac{1}{2} \text{ yd.} \qquad 5\frac{1}{2} \times 3\frac{1}{2} = \frac{21}{4} \times \frac{10}{2} = \frac{35}{2} = 17\frac{1}{2}. \\ 17\frac{1}{2} \text{ sq. yd.} \text{ Ans.}$$

4. At \$0.92 a yard, what is the cost of a carpet 27 in. wide for a room $28\frac{1}{2}$ ft. by $18\frac{1}{2}$ ft., if the strips run lengthwise?

$$27 \text{ in.} = 2\frac{1}{4} \text{ ft.}; \quad 28\frac{1}{2} \text{ ft.} = 9\frac{1}{2} \text{ yd.} \qquad 18\frac{1}{2} \div 2\frac{1}{4} = \frac{25}{4} \times \frac{4}{9} = \frac{25}{9} = 8\frac{1}{3}.$$

Hence, 9 strips will be required.

$$9 \times 9\frac{1}{2} \text{ yd.} = 85\frac{1}{2} \text{ yd.}$$

$$\begin{array}{r} \$0.92 \\ 85\frac{1}{2} \\ \hline 46 \\ 460 \\ 736 \\ \hline \$78.66 \text{ Ans.} \end{array}$$

5. Find the cost of carpet 30 in. wide, at \$1.25 per yard, for a room 18 ft. by 14 ft., if the strips run lengthwise.

$$30 \text{ in.} = 2\frac{1}{2} \text{ ft.}; \quad 18 \text{ ft.} = 6 \text{ yd.} \qquad 14 \div 2\frac{1}{2} = \frac{2}{5} \times 14 = \frac{28}{5} = 5\frac{3}{5}.$$

Hence, 6 strips will be required.

$$\begin{array}{r} 3 \quad 3 \\ 6 \times 6 \times 5\frac{3}{5} = \$45. \text{ Ans.} \\ 4 \\ 2 \end{array}$$

6. Find the cost of carpeting 27 in. wide, at \$1.12½ per yard, for a room 29 ft. 9 in. by 23 ft. 6 in., if the strips run across the room.

$$27 \text{ in.} = 2\frac{1}{4} \text{ ft.}; \quad 29 \text{ ft. } 9 \text{ in.} = 29\frac{1}{4} \text{ ft.}; \quad 23 \text{ ft. } 6 \text{ in.} = 7\frac{1}{2} \text{ yd.}$$

$$29\frac{1}{4} \div 2\frac{1}{4} = \frac{119}{4} \times \frac{4}{9} = \frac{119}{9} = 13\frac{1}{9}.$$

Hence, 14 strips will be required.

$$14 \times 7\frac{1}{2} \times \$1\frac{1}{8} = 1\cancel{4}^7 \times \frac{47}{\cancel{8}_2} \times \frac{9}{8} = \$\frac{987}{8} = \$123.38. \text{ Ans.}$$

7. Find the cost of carpeting 27 in. wide, at \$2.75 per yard, for a room 34 ft. 8 in. by 13 ft. 3 in., if the strips run lengthwise, and if there is a waste of ¼ yd. a strip.

$$27 \text{ in.} = 2\frac{1}{4} \text{ ft.}; \quad 13 \text{ ft. } 3 \text{ in.} = 13\frac{1}{4} \text{ ft.} \quad 13\frac{1}{4} \div 2\frac{1}{4} = \frac{53}{4} \times \frac{4}{9} = \frac{53}{9} = 5\frac{8}{9}.$$

Hence, 6 strips will be required.

$$34 \text{ ft. } 8 \text{ in.} = 11\frac{1}{2} \text{ yd.} \quad 11\frac{1}{2} \text{ yd.} + \frac{1}{4} \text{ yd.} = 11\frac{3}{4} \text{ yd.}$$

$$6 \times 11\frac{3}{4} \times \$2\frac{1}{2} = 6 \times \frac{425}{36} + \frac{11}{4} = \$\frac{4675}{24} = \$194.79. \text{ Ans.}$$

8. Which way must the strips of carpet 27 in. wide run to carpet most economically a room 20½ ft. by 19½ ft.?

$$27 \text{ in.} = 2\frac{1}{4} \text{ ft.} \quad 20\frac{1}{2} \div 2\frac{1}{4} = \frac{41}{2} \times \frac{4}{9} = \frac{82}{9} = 9\frac{1}{9}.$$

Hence, if the strips run across the room, 10 strips will be required.

$$10 \times 19\frac{1}{2} \text{ ft.} = 195 \text{ ft.} = 65 \text{ yd.} \quad 19\frac{1}{2} \div 2\frac{1}{4} = \frac{39}{2} \times \frac{4}{9} = \frac{26}{3} = 8\frac{2}{3}.$$

Hence, if the strips run lengthwise, 9 strips will be required.

$$9 \times 20\frac{1}{2} \text{ ft.} = 184\frac{1}{2} \text{ ft.} = 61\frac{1}{2} \text{ yd.}$$

Hence, it takes 3½ yd. less if the strips run lengthwise.

$$1 \text{ lb. av. of water occupies } \frac{1728}{62.5} \text{ cu. in.}$$

$$1 \text{ lb. troy of water occupies } \frac{1728}{62.5 \times \frac{7000}{5780}} \text{ cu. in.}$$

$$1 \text{ lb. troy of gold occupies } \frac{1728}{19.36 \times 62.5 \times \frac{7000}{5780}} \text{ cu. in.}$$

$$2\frac{1}{2} \text{ lb. troy of gold occupies } \frac{2\frac{1}{2} \times 1728}{19.36 \times 62.5 \times \frac{7000}{5780}} \text{ cu. in.}$$

$$\frac{2\frac{1}{2} \times 1728}{19.36 \times 62.5 \times \frac{7000}{5780}} = \frac{2\frac{1}{2} \times 1728}{19\frac{2}{5} \times 62\frac{1}{2} \times \frac{7000}{5780}}$$

$$= \frac{61}{24} \times \frac{432}{1728} \times \frac{25}{121} \times \frac{2}{5} \times \frac{5780}{7000}$$

$$= \frac{316224}{105875} = 2.987.$$

10. How many pounds does a boy lift in raising a cubic foot of stone under water, if its specific gravity is 2½?

The boy lifts 2½ times the weight of a cubic foot of water less the weight of a cubic foot of water; that is, he lifts 1½ times the weight of a cubic foot of water.

$$1\frac{1}{2} \times 62.5 \text{ lb.} = 93.75 \text{ lb. } \textit{Ans.}$$

11. A square-built scow 12 ft. long, $6\frac{1}{2}$ ft. wide, sinks 5 in. into the water. What does it weigh, and how many pounds will be required to sink it 7 in. deeper?

The weight of the scow is equal to the weight of the water it displaces.

$$12 \times 6\frac{1}{2} \times \frac{5}{12} \times 62\frac{1}{2} = \cancel{12} \times \frac{13}{2} \times \frac{5}{\cancel{12}} \times \frac{125}{2} = \frac{8125}{4} = 2031\frac{1}{4}.$$

2031 $\frac{1}{4}$ lb. *Ans.*

$$12 \times 6\frac{1}{2} \times 1 \times 62\frac{1}{2} = \overset{3}{\underset{6}{\cancel{12}}} \times \frac{13}{2} \times \frac{125}{2} = 4875.$$

4875 lb. - 2031 $\frac{1}{4}$ lb. = 2843 $\frac{3}{4}$ lb. *Ans.*

12. A square-built scow 11 ft. long, $5\frac{1}{4}$ ft. wide, weighs 320 lb. and is loaded with 750 lb. of stone. How deep will it sink in the water?

The total weight of the scow is 320 lb. + 750 lb. = 1070 lb.

The volume in cubic feet of the water displaced is $\frac{1070}{62\frac{1}{2}}$.

The area in square feet of the top of the scow is $11 \times 5\frac{1}{4}$.

Therefore, the depth in feet the scow will sink is $\frac{1070}{62\frac{1}{2}} \div (11 \times 5\frac{1}{4})$,

and the depth in inches the scow will sink is $12 \times \frac{1070}{62\frac{1}{2}} \div (11 \times 5\frac{1}{4})$.

$$\begin{aligned} 12 \times \frac{1070}{62\frac{1}{2}} \div (11 \times 5\frac{1}{4}) &= \cancel{12} \times \frac{214}{\cancel{1070}} \times \frac{2}{\frac{125}{25}} \times \frac{1}{11} \times \frac{4}{\frac{21}{7}} \\ &= \frac{6848}{1925} = 3\frac{1072}{1925} = 3.557. \quad 3.557 \text{ in. } \textit{Ans.} \end{aligned}$$

13. How many tons of ice, specific gravity 0.93, can be packed in a building 50 ft. long, 40 ft. wide, 20 ft. high?

$$\begin{aligned} \frac{50 \times 40 \times 20 \times 0.93 \times 62\frac{1}{2}}{2000} &= \frac{\cancel{50} \times \cancel{40} \times \cancel{20}}{\frac{2000}{40}} \times \frac{93}{\frac{100}{5}} \times \frac{\frac{125}{2}}{2} = \frac{2325}{2} \\ &= 1162\frac{1}{2}. \textit{ Ans.} \end{aligned}$$

14. If the specific gravity of an iceberg is 0.9, how many cubic yards does an iceberg contain that is 40 rd. long, 6 yd. wide, and rises 160 ft. out of the sea?

$$40 \text{ rd.} = 220 \text{ yd.} ; \quad 160 \text{ ft.} = 53\frac{1}{3} \text{ yd.}$$

$$220 \times 6 \times 53\frac{1}{3} = 220 \times \cancel{6}^2 \times \frac{160}{\cancel{3}} = 70,400.$$

Now, if the specific gravity of the iceberg is 0.9, only $\frac{1}{10}$ of the iceberg is above the water.

$$10 \times 70,400 \text{ cu. yd.} = 704,000 \text{ cu. yd.} \text{ Ans.}$$

15. If a cubic foot of brick wall weighs 90 lb. and contains 22 bricks, with the mortar, what is the weight and the specific gravity of a brick and its share of mortar?

$$90 \text{ lb.} \div 22 = 4\frac{1}{11} \text{ lb.} \text{ Ans.}$$

$$\text{The specific gravity} = \frac{90}{62\frac{1}{2}} = \frac{18}{\cancel{12}^6} \times \frac{2}{\cancel{12}^6} = \frac{36}{25} = 1.44. \text{ Ans.}$$

16. What is the weight of a brick wall 40 ft. long, 20 ft. high, and 1 ft. thick, if the specific gravity of a brick with its mortar is 1.46? How many thousand bricks will be required for the wall, allowing 22 for a cubic foot?

$$40 \times 20 \times 1 \times 1.46 \times 62\frac{1}{2} = \cancel{40}^{20} \times \cancel{20}^{20} \times \frac{146}{\cancel{100}^5} \times \frac{\cancel{125}^{25}}{2} = 73,000.$$

$$73,000 \text{ lb.} = 36\frac{1}{2} \text{ t.} \text{ Ans.} \quad 40 \times 20 \times 1 \times 22 = 17,600. \text{ Ans.}$$

17. If the specific gravity of iron is 7.48, what is the weight of a cylindrical iron shell 1 in. thick and 2 ft. long, whose inner radius is 7 in.?

The outer radius is 8 in. = $\frac{2}{3}$ ft.

$$\frac{1.0472}{\cancel{3.1416}^{\cancel{0.2618}}} \times \frac{2}{\cancel{3}} \times \frac{2}{\cancel{3}} \times 2 = \frac{8.3776}{3} = 2.7925.$$

The inner radius is 7 in. = $\frac{7}{12}$ ft.

$$\frac{0.1309}{\cancel{3.1416}^{\cancel{0.2618}}} \times \frac{7}{\cancel{12}} \times \frac{7}{\cancel{12}} \times 2 = \frac{6.4141}{3} = 2.1380.$$

The volume of the shell = 2.7925 cu. ft. - 2.1380 cu. ft. = 0.6545 cu. ft.

The weight of the shell = $0.6545 \times 7.48 \times 62.5$ lb. = 305.97875 lb. *Ans.*

18. If a piece of marble weighs 37.78 oz. in air, and 23.89 oz. in water, what is its volume and its specific gravity?

The weight of the water displaced by the marble is

$$37.78 \text{ oz.} - 23.89 \text{ oz.} = 13.89 \text{ oz.}$$

By Ex. 1, the volume of 1 oz. of water is 1.728 cu. in.

19. If a mass of lead weighs $1986\frac{1}{4}$ lb. in air, and $1811\frac{1}{4}$ lb. in water, what is its volume and its specific gravity?

The weight of the water displaced by the lead is $1986\frac{1}{4}$ lb. - $1811\frac{1}{4}$ lb. = 175 lb.

Since 1 cu. ft. of water weighs $62\frac{1}{2}$ lb., the volume of the lead is

$$\frac{175}{62\frac{1}{2}} \text{ cu. ft.} = \frac{7}{175} \times \frac{2}{125} \text{ cu. ft.} = \frac{14}{5} \text{ cu. ft.} = 2\frac{4}{5} \text{ cu. ft.} \text{ } \textit{Ans.}$$

The specific gravity of the lead

$$= 1986\frac{1}{4} \div 175 = \frac{227}{4} \times \frac{1}{175} = \frac{227}{700} = 11\frac{7}{20} = 11.35. \text{ } \textit{Ans.}$$

Exercise 93. Page 201.

1. If one man can do a piece of work in 9 days and another man can do the same work in 8 days, in how many days can the men working together do the work ?

If one man can do the work in 9 days, in 1 day he can do $\frac{1}{9}$ of it.

If another man can do the work in 8 days, in 1 day he can do $\frac{1}{8}$ of it.

Both together can do $\frac{1}{9} + \frac{1}{8} = \frac{17}{72}$ of the work in 1 day.

Therefore, both together can do the work in $\frac{72}{17}$ days, or $4\frac{4}{17}$ days.

Ans.

2. A cistern can be filled by a water-pipe in 30 min., and emptied by a waste-pipe in 20 min. If the cistern is full and both pipes are opened, in how many minutes will the cistern be emptied ?

If the water-pipe will fill the cistern in 30 min., in 1 min. it will fill $\frac{1}{30}$ of the cistern.

If the waste-pipe will empty the cistern in 20 min., in 1 min. it will empty $\frac{1}{20}$ of the cistern.

When both are opened $\frac{1}{20} - \frac{1}{30} = \frac{1}{60}$ will be emptied each minute.

Therefore, when both are opened, the cistern will be emptied in $\frac{60}{1}$ min., or 60 min. *Ans.*

3. If A can mow a certain meadow in 4 days, and B in 3 days, how long will it take both together ?

If A can mow the meadow in 4 days, in 1 day he can mow $\frac{1}{4}$ of it.

If B can mow the meadow in 3 days, in 1 day he can mow $\frac{1}{3}$ of it.

Both together can mow $\frac{1}{4} + \frac{1}{3} = \frac{7}{12}$ of the meadow in 1 day.

Therefore, both together can mow the meadow in $\frac{12}{7}$ days, or $1\frac{5}{7}$ days. *Ans.*

4. If A can lay a certain wall in $4\frac{1}{2}$ days, and B in $5\frac{1}{2}$ days, how long will it take both together ?

If A can lay the wall in $4\frac{1}{2}$ days, in 1 day he can lay $\frac{1}{4\frac{1}{2}} = \frac{2}{9}$ of it.

If B can lay the wall in $5\frac{1}{2}$ days, in 1 day he can lay $\frac{1}{5\frac{1}{2}} = \frac{2}{11}$ of it.

Both together can lay $\frac{2}{9} + \frac{2}{11} = \frac{38}{99}$ of it in 1 day.

Therefore, both together can lay the wall in $\frac{99}{38}$ days, or $2\frac{13}{38}$ days. *Ans.*

5. If one pipe will fill a cistern in $4\frac{1}{2}$ hr., and another pipe in $3\frac{1}{2}$ hr., how long will it take both together to fill the cistern ?

If one pipe will fill the cistern in $4\frac{1}{2}$ hr., in 1 hr. it will fill $\frac{1}{4\frac{1}{2}} = \frac{2}{9}$ of it.

If another pipe will fill the cistern in $3\frac{1}{2}$ hr., in 1 hr. it will fill $\frac{1}{3\frac{1}{2}} = \frac{2}{7}$ of it.

Both pipes together will fill $\frac{2}{9} + \frac{2}{7} = \frac{32}{63}$ of the cistern in 1 hr.

Therefore, both pipes together will fill the cistern in $\frac{63}{32} = 1\frac{31}{32}$ hr. *Ans.*

6. If A can go from Boston to Albany in $9\frac{1}{4}$ hr., and B from Albany to Boston in $11\frac{1}{2}$ hr., and they start at the same time, in how many hours will they meet ?

If A can go in $9\frac{1}{4}$ hr., in 1 hr. he can go $\frac{1}{9\frac{1}{4}} = \frac{4}{37}$ of the distance.

If B can go in $11\frac{1}{2}$ hr., in 1 hr. he can go $\frac{1}{11\frac{1}{2}} = \frac{2}{23}$ of the distance.

Both together can go $\frac{4}{37} + \frac{2}{23} = \frac{247}{1258}$ of the distance in 1 hr.

Therefore, they will meet in $\frac{1258}{247}$ hr. = $5\frac{23}{47}$ hr. *Ans.*

7. If it takes A working alone 4 days, B 3 days, and C $4\frac{1}{2}$ days to do a piece of work, how long will it take to do the work if all three work together ?

If A can do the work in 4 days, in 1 day he can do $\frac{1}{4}$ of it.

If B can do the work in 3 days, in 1 day he can do $\frac{1}{3}$ of it.

If C can do the work in $4\frac{1}{2}$ days, in 1 day he can do $\frac{1}{4\frac{1}{2}} = \frac{2}{9}$ of it.

All together can do $\frac{1}{4} + \frac{1}{3} + \frac{2}{9} = \frac{11}{18}$ of the work in 1 day.

Therefore, it will take them, all working together, $\frac{18}{11}$ days = $1\frac{7}{11}$ days. *Ans.*

8. A can mow $\frac{2}{3}$ of a field in 3 days ; B can mow $\frac{1}{3}$ of it in 4 days. How long will it take both together to mow the field ?

$$3 \text{ days} \div \frac{2}{3} = 5\frac{1}{2} \text{ days} ; 4 \text{ days} \div \frac{1}{3} = 6 \text{ days}.$$

If A can mow the field in $5\frac{1}{2}$ days, in 1 day he can mow $\frac{1}{5\frac{1}{2}} = \frac{2}{11}$ of it.

If B can mow the field in 6 days, in 1 day he can mow $\frac{1}{6}$ of it.

Both together can mow $\frac{2}{11} + \frac{1}{6} = \frac{13}{66}$ of the field in 1 day.

Therefore, both together can mow the field in $\frac{66}{13}$ days = $2\frac{10}{13}$ days.

Ans.

9. One pipe can fill a cistern half full in $\frac{3}{4}$ of an hour, and another can fill it three quarters full in $\frac{1}{2}$ an hour. How long will it take both pipes together to fill the cistern ?

$$\frac{3}{4} \text{ hr.} \div \frac{1}{2} = 1\frac{1}{2} \text{ hr.} ; \frac{1}{2} \text{ hr.} \div \frac{3}{4} = \frac{2}{3} \text{ hr.}$$

If one pipe can fill the cistern in $1\frac{1}{2}$ hr., in 1 hr. it can fill $\frac{1}{1\frac{1}{2}} = \frac{2}{3}$ of it.

If another pipe can fill the cistern in $\frac{2}{3}$ hr., in 1 hr. it can fill $\frac{1}{\frac{2}{3}} = \frac{3}{2}$ of it.

Both together can fill $\frac{2}{3} + \frac{3}{2} = \frac{13}{6}$ of the cistern in 1 hr.

Therefore, both together can fill the cistern in $6 \div 13 = \frac{6}{13}$ hr. *Ans.*

10. A pipe can fill a cistern one third full in $\frac{1}{4}$ of an hour ; a waste-pipe can empty one fourth of the cistern in 20 minutes. If both pipes are opened, in what time will the cistern be filled ?

$$3 \times \frac{1}{4} \text{ hr.} = \frac{3}{4} \text{ hr.} = 45 \text{ min.} ; 4 \times 20 = 80 \text{ min.}$$

The water-pipe can fill $\frac{1}{45}$ every minute.

The waste-pipe can empty $\frac{1}{80}$ every minute.

When both are open, $\frac{1}{45} - \frac{1}{80} = \frac{7}{720}$ is gained every minute.

Therefore, the whole will be filled in $\frac{720}{7}$ min. = $102\frac{6}{7}$ min. *Ans.*

11. A cistern that will hold 100 gallons can be filled by a pipe in 25 minutes, and emptied by a waste-pipe in 45 minutes. If the cistern is empty and both pipes are opened, how long will it take to fill the cistern, and how much water will be wasted ?

The water-pipe fills $\frac{1}{25}$ every minute.

The waste-pipe empties $\frac{1}{45}$ every minute.

When both are open, $\frac{1}{25} - \frac{1}{45} = \frac{2}{225}$ is gained every minute.

Therefore, the whole will be filled in $\frac{225}{2}$ min. = $56\frac{1}{2}$ min. *Ans.*

If $\frac{1}{45}$ of the cistern is wasted every minute, the number of gallons

wasted =

$$56\frac{1}{2} \times \frac{1}{45} \text{ of } 100 = \frac{225}{4} \times \frac{1}{45} \times 100 = 125.$$

125 gal. *Ans.*

12. If water runs into a cistern by one pipe at the rate of 2 gal. in 3 min., by another at the rate of 5 gal. in 4 min., and runs out by a third at the rate of 4 gal. in 5 min., how long will it take to gain 71 gal. in the cistern?

$$2 \text{ gal.} \div 3 = \frac{2}{3} \text{ gal.}; 5 \text{ gal.} \div 4 = \frac{5}{4} \text{ gal.}; 4 \text{ gal.} \div 5 = \frac{4}{5} \text{ gal.}$$

If one pipe pours in $\frac{2}{3}$ gal. per minute, another pours in $\frac{5}{4}$ gal. per minute, and another empties $\frac{4}{5}$ gal. per minute, the cistern gains $\frac{2}{3} + \frac{5}{4} - \frac{4}{5} = \frac{67}{60}$ gal. per minute.

Therefore, it will take as many minutes to gain 71 gal. as $71 \div \frac{67}{60} = 63\frac{2}{3}$. 63 $\frac{2}{3}$ min. *Ans.*

13. A can do a piece of work in 6 days, and B can do it in 7 days. If they work together 2 days, and A then leaves, how long will it take B to finish the work?

If A can do the work in 6 days, in 1 day he can do $\frac{1}{6}$ of it.

If B can do the work in 7 days, in 1 day he can do $\frac{1}{7}$ of it.

A and B together can do $\frac{1}{6} + \frac{1}{7} = \frac{13}{42}$ of the work in 1 day, and in 2 days can do $2 \times \frac{13}{42} = \frac{13}{21}$ of the work.

The part of the work then not done is $\frac{29}{42} - \frac{13}{42} = \frac{16}{42} = \frac{8}{21}$.

To do $\frac{8}{21}$ of the work, it will take B ($\frac{8}{21} \div \frac{1}{7}$) days = $2\frac{2}{3}$ days. *Ans.*

14. A cistern that will hold 200 gal. has two pipes; one will supply 0.15 gal. a second, the other $1\frac{1}{2}$ qt. a second. If the first is turned on for 10 minutes, and afterwards both run together, in what time will the cistern be filled?

0.15 gal. per sec. is $60 \times 0.15 \text{ gal.} = 9 \text{ gal. per min.}$

$1\frac{1}{2}$ qt. per sec. is $60 \times 1\frac{1}{2} \text{ qt.} = 24 \text{ gal. per min.}$

In 10 min. the first pipe will supply $10 \times 9 \text{ gal.} = 90 \text{ gal.}$

There remains to be filled $200 \text{ gal.} - 90 \text{ gal.} = 110 \text{ gal.}$

Since the two pipes together supply $9 \text{ gal.} + 24 \text{ gal.} = 33 \text{ gal. per minute,}$ to supply 110 gal. will require $\frac{110}{33} \text{ min.} = 3\frac{1}{3} \text{ min.}$ *Ans.*

15. A and B together can do a piece of work in 15 days. After working together 6 days, A leaves and B finishes the work in 30 days more. In how many days can each alone do the work?

A and B together can do $\frac{1}{15}$ of the work in 1 day, and in 6 days can do $6 \times \frac{1}{15} = \frac{2}{5}$ of the work.

There remains $\frac{3}{5} - \frac{2}{5} = \frac{1}{5}$ of the work to be done.

If B can do $\frac{1}{5}$ of the work in 30 days, B alone can do the work in $\frac{1}{5}$ of 30 days = 6 days. *Ans.*

B alone can do $\frac{1}{50}$ of the work in 1 day.

Therefore, A alone can do $\frac{1}{15} \div \frac{1}{50} = \frac{10}{3}$ of the work in 1 day.

Therefore, A alone can do the work in $1\frac{2}{3}$ days = $21\frac{2}{3}$ days. *Ans.*

16. A and B together can do a piece of work in 12 days. After working together 9 days, however, they call in C to help them, and the three finish the work in 2 days. In how many days can C alone do the work?

A and B together can do $\frac{1}{12}$ of the work in 1 day, and in 9 days can do $9 \times \frac{1}{12} = \frac{3}{4}$ of the work.

There remains $1 - \frac{3}{4} = \frac{1}{4}$ of the work to be done.

If A, B, and C together can do $\frac{1}{4}$ of the work in 2 days, to do the whole work would require them 4×2 days = 8 days.

Therefore, C alone in 1 day can do $\frac{1}{8} - \frac{1}{12} = \frac{1}{24}$ of the work.

Therefore, C alone can do the work in 24 days. *Ans.*

17. A and B can do a piece of work in $2\frac{1}{2}$ days; A and C in $3\frac{1}{2}$ days; B and C in $3\frac{1}{2}$ days. How long will it take the three working together to do the work, and how long will it take each alone?

If A and B can do the work in $2\frac{1}{2}$ days, they can do $\frac{1}{2\frac{1}{2}} = \frac{2}{5}$ of it in 1 day.

If A and C can do the work in $3\frac{1}{2}$ days, they can do $\frac{1}{3\frac{1}{2}} = \frac{2}{7}$ of it in 1 day.

If B and C can do the work in $3\frac{1}{2}$ days, they can do $\frac{1}{3\frac{1}{2}} = \frac{2}{7}$ of it in 1 day.

All together in 2 days can do $\frac{2}{5} + \frac{2}{7} + \frac{2}{7} = \frac{12}{7}$ of the work.

Hence, by working 1 day each they can do $\frac{1}{2}$ of $\frac{12}{7}$ or $\frac{6}{7}$ of the work.

Therefore, all together can do the work in $\frac{6}{7}$ days = $2\frac{2}{7}$ days. *Ans.*

In 1 day A can do $\frac{6}{7} - \frac{2}{7} = \frac{4}{7}$ of the work.

Therefore, A can do the work in $\frac{7}{4}$ days = $1\frac{3}{4}$ days. *Ans.*

In 1 day B can do $\frac{6}{7} - \frac{2}{7} = \frac{4}{7}$ of the work.

Therefore, B can do the work in $\frac{7}{4}$ days = $1\frac{3}{4}$ days. *Ans.*

In 1 day C can do $\frac{6}{7} - \frac{2}{7} = \frac{4}{7}$ of the work.

Therefore, C can do the work in $\frac{7}{4}$ days = $1\frac{3}{4}$ days. *Ans.*

18. A and B together can do a piece of work in 48 days ; A and C together in 30 days ; B and C together in $26\frac{2}{3}$ days. How long will it take each alone to do the work ?

If A and B can do the work in 48 days, they can do $\frac{1}{48}$ of it in 1 day.

If A and C can do the work in 30 days, they can do $\frac{1}{30}$ of it in 1 day.

If B and C can do the work in $26\frac{2}{3}$ days, they can do $\frac{1}{26\frac{2}{3}} = \frac{3}{80}$ of it in 1 day.

All together in 2 days can do $\frac{1}{48} + \frac{1}{30} + \frac{3}{80} = \frac{11}{120}$ of the work.

Hence, by working 1 day each, they can do $\frac{1}{2}$ of $\frac{11}{120}$ or $\frac{11}{240}$ of the work.

In 1 day A can do $\frac{11}{240} - \frac{3}{80} = \frac{1}{120}$ of the work.

Therefore, A can do the work in 120 days. *Ans.*

In 1 day B can do $\frac{11}{240} - \frac{1}{30} = \frac{1}{80}$ of the work.

Therefore, B can do the work in 80 days. *Ans.*

In 1 day C can do $\frac{11}{240} - \frac{1}{48} = \frac{1}{40}$ of the work.

Therefore, C can do the work in 40 days. *Ans.*

19. A cistern has three pipes. The first and second will fill it in 1 hr. 10 min.; the first and third in 1 hr. 24 min.; the second and third in 2 hr. 20 min. How long will it take each alone to fill the cistern ?

1 hr. 10 min. = $1\frac{1}{6}$ hr.; 1 hr. 24 min. = $1\frac{2}{5}$ hr.; 2 hr. 20 min. = $2\frac{1}{3}$ hr.

If the 1st and 2d will fill the cistern in $1\frac{1}{6}$ hr., they will fill $\frac{1}{1\frac{1}{6}} = \frac{6}{7}$ of it in 1 hr.

If the 1st and 3d will fill the cistern in $1\frac{2}{5}$ hr., they will fill $\frac{1}{1\frac{2}{5}} = \frac{5}{7}$ of it in 1 hr.

If the 2d and 3d will fill the cistern in $2\frac{1}{3}$ hr., they will fill $\frac{1}{2\frac{1}{3}} = \frac{3}{7}$ of it in 1 hr.

All together in 2 hr. will fill $\frac{6}{7} + \frac{5}{7} + \frac{3}{7} = \frac{14}{7}$ of the cistern.

Hence, in 1 hr. the three together will fill $\frac{1}{2}$ of $\frac{14}{7} = \frac{7}{7}$ or the whole cistern.

In 1 hr., the 1st will fill $\frac{7}{7} - \frac{3}{7} = \frac{4}{7}$ of the cistern.

Therefore, 1st will fill the cistern in $\frac{7}{4}$ hr. = $1\frac{3}{4}$ hr. = 1 hr. 45 min. *Ans.*

In 1 hr., the 2d will fill $\frac{7}{7} - \frac{6}{7} = \frac{1}{7}$ of the cistern.

Therefore, 2d will fill the cistern in $\frac{7}{1}$ hr. = 7 hr. = 7 hr. 0 min. *Ans.*

In 1 hr., the 3d will fill $\frac{7}{7} - \frac{6}{7} = \frac{1}{7}$ of the cistern.

Therefore, the 3d will fill the cistern in 7 hr. *Ans.*

20. A, B, and C together can do a piece of work in 10 days; A and B together in 12 days; B and C together in 20 days. How long will it take each alone to do the work?

If A, B, and C can do the work in 10 days, they can do $\frac{1}{10}$ of it in 1 day.

If A and B can do the work in 12 days, they can do $\frac{1}{12}$ of it in 1 day.

If B and C can do the work in 20 days, they can do $\frac{1}{20}$ of it in 1 day.

In 1 day C can do $\frac{1}{10} - \frac{1}{12} = \frac{1}{60}$ of the work.

Therefore, C can do the work in 60 days. *Ans.*

In 1 day B can do $\frac{1}{20} - \frac{1}{60} = \frac{1}{30}$ of the work.

Therefore, B can do the work in 30 days. *Ans.*

In 1 day A can do $\frac{1}{12} - \frac{1}{30} = \frac{1}{20}$ of the work.

Therefore, A can do the work in 20 days. *Ans.*

Exercise 95. Page 206.

1. At what time between 5 and 6 o'clock do the hour and minute hands of a clock coincide?

Since in one hour the hour hand moves through 5 minute-spaces, and the minute hand through 60 minute-spaces, the minute hand moves 12 times as fast as the hour hand, and in moving through 12 minute-spaces gains 11 minute-spaces.

When the hour hand is at V, the minute hand, being at XII, is 25 minute-spaces behind. Since to gain 11 minute-spaces the minute hand must move through 12 minute-spaces, to gain 1 minute-space the minute hand must pass through $\frac{12}{11}$ of 1 minute-space, and to gain 25 minute-spaces, it must pass through $25 \times \frac{12}{11}$, or $27\frac{3}{11}$ minute-spaces.

Hence, the hands coincide when the minute hand has moved through $27\frac{3}{11}$ minute-spaces; that is, at $27\frac{3}{11}$ minutes after 5 o'clock. *Ans.*

2. At what time between 10 and 11 o'clock do the hour and minute hands of a watch coincide?

At 10 o'clock the minute hand is 50 minute-spaces behind the hour hand.

$$50 \times \frac{12}{11} = \frac{600}{11} = 54\frac{6}{11}. \quad 54\frac{6}{11} \text{ minutes after 10 o'clock. } \textit{Ans.}$$

3. At what time between 1 and 2 o'clock do the hour and minute hands of a clock coincide?

At 1 o'clock the minute hand is 5 minute-spaces behind the hour hand.

$$5 \times \frac{1}{11} = \frac{5}{11} = 5\frac{5}{11}. \quad 5\frac{5}{11} \text{ minutes after 1 o'clock. } \textit{Ans.}$$

4. At what time between 8 and 9 o'clock are the hands of a clock exactly opposite each other?

At 8 o'clock the minute hand is 40 minute-spaces behind the hour hand, and should be 30 minute-spaces behind the hour hand.

Therefore, the minute hand must gain $40 - 30$, or 10 minute-spaces on the hour hand.

$$10 \times \frac{1}{11} = \frac{10}{11} = 10\frac{10}{11}. \quad 10\frac{10}{11} \text{ minutes after 8 o'clock. } \textit{Ans.}$$

5. At what time between 11 and 12 o'clock are the hands of a clock exactly opposite each other?

At 11 o'clock the minute hand is 55 minute-spaces behind the hour hand, and should be 30 minute-spaces behind the hour hand.

Therefore, the minute hand must gain $55 - 30$, or 25 minute-spaces on the hour hand.

$$25 \times \frac{1}{11} = \frac{25}{11} = 27\frac{3}{11}. \quad 27\frac{3}{11} \text{ minutes after 11 o'clock. } \textit{Ans.}$$

6. At what time between 4 and 5 o'clock are the hands of a clock exactly opposite each other?

At 4 o'clock the minute hand is 20 minute-spaces behind the hour hand, and should be 30 minute-spaces ahead of the hour hand.

Therefore, the minute hand must gain $20 + 30$, or 50 minute-spaces on the hour hand.

$$50 \times \frac{1}{11} = \frac{50}{11} = 54\frac{6}{11}. \quad 54\frac{6}{11} \text{ minutes after 4 o'clock. } \textit{Ans.}$$

7. At what time between 2 and 3 o'clock do the hands of a clock make right angles with each other?

At 2 o'clock the minute hand is 10 minute-spaces behind the hour hand, and should be 15 minute-spaces ahead of the hour hand.

Therefore, the minute hand must gain $10 + 15$, or 25 minute-spaces on the hour hand.

$$25 \times \frac{1}{11} = \frac{25}{11} = 27\frac{3}{11}. \quad 27\frac{3}{11} \text{ minutes after 2 o'clock. } \textit{Ans.}$$

8. At what times between 6 and 7 o'clock do the hands of a watch make right angles with each other?

At 6 o'clock the minute hand is 30 minute-spaces behind the hour hand, and should be 15 minute-spaces behind, or 15 minute-spaces ahead of the hour hand.

Therefore, the minute hand must gain $30 - 15$, or 15 minute-spaces on the hour hand, or must gain $30 + 15$, or 45 minute-spaces on the hour hand.

$$15 \times \frac{1}{2} = \frac{15}{2} = 16\frac{1}{2}.$$

$$45 \times \frac{1}{2} = \frac{45}{2} = 49\frac{1}{2}.$$

$16\frac{1}{2}$ minutes after 6 o'clock, or $49\frac{1}{2}$ minutes after 6 o'clock.

Ans.

9. At what time between 7 and 8 o'clock do the hands of a watch make an angle of 120° with each other?

At 7 o'clock the minute hand is 35 minute-spaces behind the hour hand, and should be 20 minute-spaces behind.

Therefore, the minute hand must gain $35 - 20$, or 15 minute-spaces on the hour hand.

$$15 \times \frac{1}{2} = \frac{15}{2} = 16\frac{1}{2}.$$

$$16\frac{1}{2} \text{ minutes after 7 o'clock. } \textit{Ans.}$$

10. At what time between 12 and 1 o'clock do the hands of a watch make an angle of 60° with each other?

At 12 o'clock the hour and minute hands coincide, and the minute hand should be 10 minute-spaces ahead of the hour hand.

Therefore, the minute hand must gain 10 minute-spaces on the hour hand.

$$10 \times \frac{1}{2} = \frac{10}{2} = 10\frac{1}{2}.$$

$$10\frac{1}{2} \text{ minutes after 12 o'clock. } \textit{Ans.}$$

Exercise 98. Page 214.

1. When water is heated from the freezing point to the boiling point, it expands $\frac{1}{4}$ in volume. Find in kilograms the weight of a cubic foot of water at the freezing point and at the boiling point.

At the freezing point 1 cu. ft. of water weighs $62\frac{1}{2}$ lb.; at the boiling point $\frac{3}{4} \times 62\frac{1}{2}$ lb. = 60 lb. 1 lb. = $\frac{5}{11}$ kg.

$$62\frac{1}{2} \times \frac{5}{11} \text{ kg} = \frac{125}{2} \times \frac{5}{11} \text{ kg} = \frac{625}{22} \text{ kg} = 28.41 \text{ kg.}$$

$$60 \times \frac{5}{11} \text{ kg} = \frac{300}{11} \text{ kg} = 27.27 \text{ kg.}$$

4. Water expands $\frac{1}{10}$ in freezing, and a floating body displaces an amount of water equal in weight to the body. What is the volume in cubic meters, and the weight in metric tons, of an iceberg floating in the ocean, if the specific gravity of sea water is 1.026, and the part of the iceberg above the water is a rectangular solid 200 ft. long, 60 ft. wide, and 12 ft. high?

If water expands $\frac{1}{10}$ in freezing, the volume of ice is $\frac{11}{10}$ of the volume of the water. Hence, the specific gravity of ice is $\frac{11}{10}$. The difference between the specific gravity of sea water and that of the iceberg is $1.026 - \frac{11}{10} = 1.026 - 0.909 = 0.117$.

Exercise 104. Page 229.

1. Divide \$12,000 proportionally to the numbers 3, 4, 5.

$$3 + 4 + 5 = 12.$$

$$\frac{3}{12} \times \$12000 = \$3000.$$

$$\frac{4}{12} \times \$12000 = \$4000.$$

$$\frac{5}{12} \times \$12000 = \$5000.$$

2. Divide 815 tons proportionally to $\frac{1}{4}$, $\frac{2}{5}$, $\frac{3}{8}$, $\frac{4}{9}$.

$$60 \times (\frac{1}{4}, \frac{2}{5}, \frac{3}{8}, \frac{4}{9}) = 30, 40, 45, 48.$$

$$30 + 40 + 45 + 48 = 163.$$

$$\frac{30}{163} \times 815 \text{ t.} = 150 \text{ t.}$$

$$\frac{40}{163} \times 815 \text{ t.} = 200 \text{ t.}$$

3. Divide 6853 lb. of wool proportionally to $1\frac{1}{2}$, $2\frac{1}{3}$, $5\frac{1}{6}$; also proportionally to the reciprocals of these numbers.

$$60 \times (\frac{1}{2}, \frac{1}{3}, \frac{1}{6}) = 105, 168, 350.$$

$$105 + 168 + 350 = 623.$$

$$\frac{105}{623} \times 6853 \text{ lb.} = 1155 \text{ lb.}$$

$$\frac{168}{623} \times 6853 \text{ lb.} = 1848 \text{ lb.}$$

16. Two capitalists contribute, one \$10,000, the other \$12,000, to an enterprise which continues in operation for 10 years. Ten months after starting a third man becomes a partner and contributes \$15,000; and 2 years after this a fourth man contributes \$17,400. If the total profits are \$45,600, what amount does each partner receive?

$$120 \times \$10,000 = \$1,200,000$$

$$120 \times 12,000 = 1,440,000$$

$$110 \times 15,000 = 1,650,000$$

$$86 \times 17,400 = 1,496,400$$

$$\underline{\$5,786,400}$$

$$\frac{500}{\frac{1,200,000}{5,786,400}} \times \$45,600 = \$ \frac{2,280,000}{2411} = \$9456.66.$$

$$\frac{600}{\frac{1,440,000}{5,786,400}} \times \$45,600 = \$ \frac{2,736,000}{2411} = \$11,347.99.$$

A.

$$7 \times \$2500 = \$17,500$$

$$4 \times 1250 = \underline{5000}$$

$$\underline{\$22,500}$$

$$\$22,500 + \$20,000 = \$42,500.$$

9. In what proportion should tea costing 60 cents a pound be mixed with tea costing 45 cents a pound that the cost of the mixture should be 54 cents a pound?

1 lb. of the 60-cent tea loses in value \$0.06, and 1 lb. of the 45-cent tea gains in value \$0.09. Hence, to make a mixture worth \$0.54 a pound, the tea must be mixed in the ratio 9 : 6 ; that is, 3 : 2. *Ans.*

10. A merchant has teas that cost 80 cents, 60 cents, and 40 cents a pound, respectively. How many pounds of each kind shall he take to make a mixture of 1000 lb., so that in selling it at 70 cents a pound he may make a profit of 8 cents a pound?

The cost of the mixture must be $\$0.70 - \$0.08 = \$0.62$ a pound.

The 80-cent tea loses in value $\$0.18$; the 60-cent gains in value $\$0.02$; and the 40-cent gains in value $\$0.22$. Hence, the merchant must mix the 80-cent and 60-cent in the ratio 2 : 18, that is, 1 : 9, and the 80-cent and the 40-cent in the ratio 22 : 18, that is, 11 : 9. Therefore, he takes the 80-cent, the 60-cent, and the 40-cent proportionally to 12 : 9 : 9; that is, 4 : 3 : 3.

Hence, he takes $\frac{4}{16}$ of 1000 lb. = 400 lb. of the 80-cent; $\frac{3}{16}$ of 1000 lb. = 300 lb. of the 60-cent; and $\frac{3}{16}$ of 1000 lb. = 300 lb. of the 40-cent. *Ans.*

11. A grocer mixed black tea that cost him 28 cents a pound with green tea that cost him 42 cents, and by selling the mixture at 35 cents a pound he gained $\frac{1}{5}$ of its cost. What was the actual cost of the mixture a pound? In what ratio were the teas mixed?

If by selling the tea at 35 cents the merchant gained $\frac{1}{5}$ of its cost, the actual cost of the mixture was $\frac{4}{5}$ of 35 cents; that is, 30 cents. *Ans.*

The 42-cent tea loses in value 12 cents, and the 28-cent gains in value 2 cents. Hence, the merchant mixed the 42-cent and the 28-cent teas in the ratio 2 : 12; that is, 1 : 6. *Ans.*

12. A dealer has an order for 1000 bu. of wheat at 70 cents a bushel. In what proportion shall he mix three kinds of wheat at 66, 69, and 72 cents a bushel to fill the order?

The 66-cent wheat gains in value 4 cents a bushel and the 72-cent loses in value 2 cents.

Hence, the dealer must mix the 66-cent and 72-cent in the ratio 2 : 4; that is, 1 : 2.

The 69-cent wheat gains in value 1 cent and the 72-cent loses in value 2 cents.

Hence, the dealer must mix the 69-cent and the 72-cent in the ratio 2 : 1.

Therefore, the dealer must take the 66-cent, the 69-cent, and the 72-cent proportionally to 1 : 2 : 3. *Ans.*

13. A wine merchant mixes wines that cost $\$0.95$, $\$1.05$, $\$1.10$, and $\$1.20$ a gallon to make a mixture costing $\$1.00$ per gallon. How many gallons of each kind of wine does he take?

The 95-cent wine gains in value 5 cents, and the 105-cent loses in value 5 cents.

Hence, the merchant must take the 95-cent and the 105-cent in the ratio 1 : 1.

The 95-cent wine gains in value 5 cents, and the 110-cent loses in value 10 cents.

Hence, the merchant must take the 95-cent and the 110-cent in the ratio 2 : 1.

The 95-cent wine gains in value 5 cents, and the 120-cent loses in value 20 cents.

Hence, the merchant must take the 95-cent and the 120-cent in the ratio 4 : 1.

Therefore, the merchant may take the 95-cent wine, the 105-cent, the 110-cent, and the 120-cent proportionally to 7 : 1 : 1 : 1. *Ans.*

14. A merchant wishes to fill a barrel that will hold 240 lb. of sugar with sugar costing $4\frac{1}{2}$, $4\frac{3}{4}$, and $5\frac{1}{2}$ cents a pound, respectively, so that the mixture may cost $4\frac{7}{8}$ cents a pound. How many pounds of each kind shall he take ?

The $4\frac{1}{2}$ -cent sugar gains in value $\frac{3}{8}$ cent, and the $5\frac{1}{2}$ -cent loses in value $\frac{3}{8}$ cent.

Hence, the merchant must take the $4\frac{1}{2}$ -cent and the $5\frac{1}{2}$ -cent in the ratio $\frac{3}{8} : \frac{3}{8}$; that is, 2 : 3.

The $4\frac{3}{4}$ -cent sugar gains in value $\frac{1}{8}$ cent, and the $5\frac{1}{2}$ -cent loses in value $\frac{3}{8}$ cent.

Hence, the merchant must take the $4\frac{3}{4}$ -cent and the $5\frac{1}{2}$ -cent in the ratio $\frac{1}{8} : \frac{3}{8}$; that is, 2 : 1.

Therefore, the merchant may take the $4\frac{1}{2}$ -cent, the $4\frac{3}{4}$ -cent, and the $5\frac{1}{2}$ -cent proportionally to 2 : 2 : 4; that is, 1 : 1 : 2.

Hence, the merchant may take $\frac{1}{4}$ of 240 lb. = 60 lb. of the $4\frac{1}{2}$ -cent, $\frac{1}{4}$ of 240 lb. = 60 lb. of the $4\frac{3}{4}$ -cent, and $\frac{1}{2}$ of 240 lb. = 120 lb. of the $5\frac{1}{2}$ -cent. *Ans.*

15. A grocer wishes to mix 12 lb. of coffee at 40 cents a pound and 20 lb. at 35 cents a pound with coffee at 28 cents a pound, so that the mixture may be worth 30 cents a pound. How many pounds at 28 cents must he use ?

$$\begin{array}{r} 12 \times \$0.40 = \$4.80 \\ 20 \times 0.35 = 7.00 \\ \hline 32 \qquad \qquad \$11.80 \end{array}$$

Hence, the average cost of the 32 lb. is $\$ \frac{11.80}{32} = \0.367 .

The 28-cent gains in value 2 cents, and the 36 $\frac{1}{2}$ -cent loses in value 6 $\frac{1}{2}$ cents.

Hence, the grocer must mix the 28-cent and the 36 $\frac{1}{2}$ -cent in the ratio 6 $\frac{1}{2}$:2; that is, 55:16, or 110 to 32.

Hence, the grocer must use 110 lb. at 28 cents. *Ans.*

16. A grocer mixed 14 lb. of coffee costing 32 cents a pound, 18 lb. costing 35 cents a pound, 22 lb. costing 38 cents a pound, and 40 lb. costing 30 cents a pound. What is the cost of the mixture per pound, and at what price must he sell it to gain 0.25 of the cost?

$$\begin{array}{r}
 14 \times \$0.32 = \$4.48 \\
 18 \times 0.35 = 6.30 \\
 22 \times 0.38 = 8.36 \\
 40 \times 0.30 = 12.00 \\
 \hline
 94 \qquad \qquad \qquad \$31.14

Therefore, the cost of the mixture per pound is

17. In what proportion may oils costing \$1.20, \$0.80, and \$0.60 a gallon be mixed that the mixture may cost \$0.70 a gallon?

The 120-cent oil loses in value 50 cents a gallon, and the 60-cent gains in value 10 cents.

Therefore, the 120-cent and the 60-cent must be mixed in the ratio 10:50; that is, 1:5.

The 80-cent oil loses in value 10 cents and the 60-cent gains in value 10 cents.

Therefore, the 80-cent and the 60-cent oils must be mixed in the ratio 10:10; that is, 1:1.

Hence, the 120-cent, the 80-cent, and the 60-cent oils may be mixed proportionally to 1:1:6. *Ans.*

14. What per cent above cost must a merchant mark his goods that he may take off 20 % from the marked price, and still make 20 % on the cost ?

Since the merchant is to make 20 % on the cost of the goods, the selling price is 120 % of the cost price.

Since the selling price is to be 20 % below the marked price, the selling price is 80 % of the marked price.

Therefore, the marked price will be $\frac{100}{80}$ of 120 % of the cost price, or 150 % of the cost price ; that is, the goods must be marked 50 % above cost.

15. What per cent above cost must a merchant mark his goods to take off 10 %, and still gain 17 % ?

Selling price = 117 % of cost price.

Selling price = 90 % of marked price.

Therefore, marked price = $\frac{100}{90}$ of 117% = 130 % of cost price.
30 % above cost. *Ans.*

16. What per cent above cost must a merchant mark his goods to take off $12\frac{1}{2}\%$, and still gain $12\frac{1}{2}\%$?

Selling price = $112\frac{1}{2}\%$ of cost price.

Selling price = $87\frac{1}{2}\%$ of marked price.

Therefore, marked price = $\frac{100}{87\frac{1}{2}}$ of $112\frac{1}{2}\%$ = $\frac{900}{7} = 128\frac{4}{7}\%$ of cost price.
 $28\frac{4}{7}\%$ above cost. *Ans.*

17. What per cent above cost must a merchant mark his goods to take off 15 %, and still gain 15 % ?

Selling price = 115 % of cost price.

Selling price = 85 % of marked price.

Therefore, marked price

= $\frac{100}{85}$ of 115% = $\frac{2300}{17}\%$ = $135\frac{5}{17}\%$ of cost price.

18. What per cent above cost must a merchant mark his goods to take off $33\frac{1}{3}\%$, and still gain $33\frac{1}{3}\%$?

Selling price = $133\frac{1}{3}\%$ of cost price.

Therefore, marked price

13. In a certain town there are 1350 polls. The assessed valuation of the real estate is \$713,250, and of the personal property is \$738,954. The poll tax is \$2 per poll, and the tax on property is 1½%. Only 96% of the property tax can be collected, and the collector is paid 2½% of the amount collected. How much does the town receive from the taxes? How much does the collector receive for his services?

Poll tax = 1350 × \$2 = \$2700.

Exercise 122. Page 264.

1. Find the rate per cent when the interest on \$326 for 15 yr. is \$220.05.

$$r = \frac{i}{pt}$$

Here $i = \$220.05$; $p = \$326$; $t = 15$ yr.

Hence,
$$r = \frac{220.05}{326 \times 15} = 0.045.$$

Therefore, the rate required is $4\frac{1}{2}\%$.

2. Find the rate per cent when the interest on \$745 for 18 yr. is \$603.45.

$$r = \frac{i}{pt}$$

Here $i = \$603.45$; $p = \$745$; $t = 18$ yr.

Hence,
$$r = \frac{603.45}{745 \times 18} = 0.045.$$

Therefore, the rate required is $4\frac{1}{2}\%$.

3. Find the rate per cent when \$980 amounts to \$1016.75 in 9 mo.

$$r = \frac{i}{pt}$$

Here $i = \$1016.75 - \$980 = \$36.75$; $p = \$980$; $t = 9$ mo. = 0.75 yr.

Hence,
$$r = \frac{36.75}{980 \times 0.75} = 0.05.$$

Therefore, the rate required is 5%.

4. Find the rate per cent when the interest on \$470.50 is \$141.15 for 5 yr.

$$r = \frac{i}{pt}$$

Here $i = \$141.15$; $p = \$470.50$; $t = 5$ yr.

Hence,
$$r = \frac{141.15}{470.50 \times 5} = 0.06.$$

Therefore, the rate required is 6%.

$$r = \frac{1}{2}$$

16. ... 1 4 6, 2 8 4 12 20 30 $r = 4$ m. 3 17 = 4 1/2 m.

Then $\frac{2.72}{(2.71)^2} = 0.97$.

Income before tax from operations is 7 1/2%

45. The principal is \$653; the interest, \$5.52; the rate, 8%. Find the time.

$$t = \frac{i}{pr}$$

Here $i = \$5.52$; $p = \$653$; $r = 8\% = 0.08$.

Hence, $t = \frac{5.52}{653 \times 0.08} = 0.1057$.

Therefore, the time required is 0.1057 yr. = 1 mo. 8 dy.

46. Find the amount of \$520 for 2 mo. 3 dy., at $4\frac{1}{2}\%$.

47. What sum bearing interest at $4\frac{1}{2}\%$ will yield an annual income of \$1000?

$$p = \frac{i}{rt}$$

Here $i = \$1000$; $r = 4\frac{1}{2}\% = 0.045$; $t = 1$ yr.

Hence, $p = \$\frac{1000}{0.045 \times 1} = \$22,222.22$.

Therefore, the principal required is \$22,222.22.

48. In what time will \$4000 amount to \$4625, at $5\frac{1}{2}\%$?

$$t = \frac{i}{pr}$$

Here $i = \$4625 - \$4000 = \$625$; $p = \$4000$; $r = 5\frac{1}{2}\% = 0.055$.

Hence, $t = \frac{625}{4000 \times 0.055} = 2.841$.

Therefore, the time required is 2.841 yr. = 2 yr. 10 mo. 3 dy.

49. At what rate per cent will \$3000 produce \$250 interest in 1 yr. 10 mo. 7 dy.?

$$r = \frac{i}{pt}$$

Here $i = \$250$; $p = \$3000$; $t = 1 \text{ yr. } 10 \text{ mo. } 7 \text{ dy.} = 1\frac{107}{365} \text{ yr.}$

Hence,
$$r = \frac{250}{3000 \times 1\frac{107}{365}} = 0.045.$$

Therefore, the rate required is $4\frac{1}{2}\%$.

50. Find the interest on \$1721.84 from April 1 to Nov. 12, at $4\frac{1}{2}\%$.

51. How long must \$3904.92 be on interest to amount to \$4568.76, at 5%?

$$t = \frac{i}{pr}$$

Here $i = \$4568.76 - \$3904.92 = \$663.84$; $p = \$3904.92$;

$$r = 5\% = 0.05.$$

Hence,
$$t = \frac{663.84}{3904.92 \times 0.05} = 3.400.$$

Therefore, the time required = 3.400 yr. = 3 yr. 4 mo. 24 dy.

39. If \$8000 5% stocks are sold at 90 and the proceeds invested in $3\frac{1}{2}\%$ stocks at 60, find the increase or decrease in income.

Income from 5% stock = 5% of \$8000 = \$400.

Proceeds from 5% stock = $80 \times \$90 = \7200 .

\$0.60 is paid for \$1 of $3\frac{1}{2}\%$ stock.

Therefore, \$7200 is paid for $\frac{\$7200}{0.60} = \$12,000$ of $3\frac{1}{2}\%$ stock.

Income from $3\frac{1}{2}\%$ stock = $3\frac{1}{2}\%$ of \$12,000 = \$420.

\$420 - \$400 = \$20, increase in income. *Ans.*

40. If \$10,000 $3\frac{1}{2}\%$ bonds are sold at 65, and the proceeds invested in 8% bonds at 130, find the increase or decrease in income.

Income from $3\frac{1}{2}\%$ bonds = $3\frac{1}{2}\%$ of \$10,000 = \$350.

Proceeds from $3\frac{1}{2}\%$ bonds = $100 \times \$65 = \6500 .

\$1.30 is paid for \$1 of 8% bonds.

Therefore, \$6500 is paid for $\frac{\$6500}{1.30} = \5000 of 8% bonds.

Income from 8% bonds = 8% of \$5000 = \$400.

\$400 - \$350 = \$50, increase in income. *Ans.*

41. If \$8000 $4\frac{1}{2}\%$ stocks are sold at 70 and the proceeds invested in 10% stocks at 160, find the increase or decrease in income.

Income from $4\frac{1}{2}\%$ stock = $4\frac{1}{2}\%$ of \$8000 = \$360.

Proceeds from $4\frac{1}{2}\%$ stock = $80 \times \$70 = \5600 .

\$1.60 is paid for \$1 of 10% stock.

Therefore, \$5600 is paid for $\frac{\$5600}{1.60} = \3500 of 10% stock.

Income from 10% stock = 10% of \$3500 = \$350.

\$360 - \$350 = \$10, decrease in income. *Ans.*

42. If \$6000 6% bonds are sold at 90, and the proceeds invested in 10% bonds at 135, find the increase or decrease in income.

Income from 6% bonds = 6% of \$6000 = \$360.

Proceeds from 6% bonds = $60 \times \$90 = \5400 .

\$1.35 is paid for \$1 of 10% bonds.

Therefore, \$5400 is paid for $\frac{\$5400}{1.35} = \4000 of 10% bonds.

Income from 10% bonds = 10% of \$4000 = \$400.

\$400 - \$360 = \$40, increase in income. *Ans.*

46. How much $3\frac{1}{2}\%$ stock must be sold at $75\frac{1}{2}$ to buy \$5000 4% stock at $94\frac{1}{2}$, brokerage $\frac{1}{2}$ on each transaction?

1 share of 4% stock costs $\$94\frac{1}{2} + \$\frac{1}{2} = \$94\frac{1}{2}$.

1 share of $3\frac{1}{2}\%$ stock sells for $\$75\frac{1}{2} - \$\frac{1}{2} = \$75$.

Therefore, the amount of stock required

$$= \frac{94\frac{1}{2} \times \$5000}{75} = \frac{189}{2} \times \$\frac{5000}{75} = \$6300. \text{ Ans.}$$

47. How much stock must be sold at $76\frac{1}{2}$ to raise a sum sufficient to discount a note for \$1075, due in 53 days, with grace, and discounted at $5\frac{1}{2}\%$?

The time of the note to run is 56 days.

The discount is the interest on \$1075 for 56 days at $5\frac{1}{2}\%$; or

$$\frac{1}{2} \times 9\frac{1}{2} \times \$1.075 = \$9.20.$$

The proceeds is $\$1075 - \$9.20 = \$1065.80$.

1 share of the stock sells for $\$76\frac{1}{2}$.

Therefore, the number of shares of stock is $\frac{1065.80}{76.125} = 14$ shares;
and the amount of the stock is $14 \times \$100 = \1400 . *Ans.*

48. A broker bought five \$1000 bonds at $88\frac{1}{2}$. At what price must he sell them to gain \$100, brokerage $\frac{1}{2}$ on each transaction?

If the broker is to gain \$100 on the transaction, he must gain $\frac{1}{5}$ of \$100 = \$20 on each bond; that is, \$2 on each \$100 of the face value of the bonds. He must also pay $\frac{1}{2} + \frac{1}{2}$ for brokerage.

Therefore, the selling price must be $88\frac{1}{2} + 2 + \frac{1}{2} + \frac{1}{2} = 90\frac{1}{2}$. *Ans.*

49. If a broker buys bonds at $87\frac{1}{2}$, at what price must he sell them to make $12\frac{1}{2}\%$ profit, brokerage $\frac{1}{2}$ on each transaction?

The price of the bonds is $87\frac{1}{2} + \frac{1}{2} = 88$.

$$88 + 12\frac{1}{2}\% \text{ of } 88 = 88 + 11 = 99.$$

The selling price of the bonds is, therefore, $99 + \frac{1}{2} = 99\frac{1}{2}$. *Ans.*

50. Which is the more profitable stock for investment, a 4 % at 85 or a 3 % at 63 ? a $3\frac{1}{2}$ % at $67\frac{1}{2}$ or a 4 % at $81\frac{1}{2}$?

Each \$85 invested in the 4 % stock yields \$4 interest ; each \$63 in the 3 % stock yields \$3 interest.

$$\begin{array}{r} 0.0470 \\ 85 \overline{)4.00} \\ \underline{340} \\ 600 \\ \underline{595} \\ 50 \end{array}$$

Therefore, the 4 % stock yields 4.71 % interest ; and the 3 %, 4.76 % . Therefore, the 3 % is the more profitable investment.

Each \$67.25 invested in the $3\frac{1}{2}$ % stock yields \$3.50 interest ; each \$81.50 in the 4 % stock yields \$4 interest.

$$\begin{array}{r} 0.0520 \\ 6725 \overline{)350.00} \\ \underline{33625} \\ 13750 \\ \underline{13450} \\ 3000 \end{array}$$

Therefore, the $3\frac{1}{2}$ % stock yields 5.20 % interest ; and the 4 %, 4.91 % . Therefore, the $3\frac{1}{2}$ % stock is the more profitable investment.

The price of a $4\frac{1}{2}$ % bond to yield $\frac{3\frac{1}{2}}{88\frac{1}{2}}$ of 100 % interest must be

$$4\frac{1}{2} \div \frac{3\frac{1}{2}}{88\frac{1}{2}} = \frac{9}{2} \times \frac{2}{7} \times \frac{177}{2} = \frac{1593}{14} = 113\frac{1}{4}. \text{ Ans.}$$

54. Find the loss in buying \$80,000 worth of bonds at $91\frac{1}{2}$ and selling at 90, brokerage $\frac{1}{8}$ on each transaction.

The cost for every \$100 of the bonds is $\$91\frac{1}{2} + \$\frac{1}{8} = \$91\frac{5}{8}$.

The price to the seller for every \$100 of the bonds is

$$\$90 - \$\frac{1}{8} = \$89\frac{7}{8}.$$

The loss on every \$100 of the bonds is $\$91\frac{5}{8} - \$89\frac{7}{8} = \$1\frac{1}{4} = \1.875 .

Therefore, the 5% stock yields 3.64% interest; the $3\frac{1}{2}\%$ stock yields 3.83%; and the $3\frac{1}{2}\%$ stock is the better investment. *Ans.*

56. A person invests \$7370 in the purchase of a stock at 92. What will be his loss if he sells at 90, brokerage $\frac{1}{8}$ on each transaction?

The buying price is $92 + \frac{1}{8} = 92\frac{1}{8}$.

The number of shares is $\frac{7370}{92\frac{1}{8}} = 80$.

The selling price is $90 - \frac{1}{8} = 89\frac{7}{8}$.

Therefore, the loss on each share is $\$92\frac{1}{8} - \$89\frac{7}{8} = \$2\frac{1}{4}$.

Therefore, the loss on 80 shares is $80 \times \$2\frac{1}{4} = \180 . *Ans.*

57. How much stock must be sold at $90\frac{1}{2}$ so that when the seller invests the proceeds in a mortgage at 6% he will receive \$543.75 annual income?

The face of the 6% mortgage is $\$543.75 \div 0.06 = \9062.50 .

The number of shares of stock at $90\frac{1}{2}$ that must be sold to amount to \$9062.50 is $\frac{9062.50}{90.625} = 100$ shares.

100 shares amount to \$10,000. *Ans.*

58. A person invests $\frac{2}{7}$ of his money at 6%, $\frac{2}{5}$ at $4\frac{1}{2}$ %, and the rest at $3\frac{1}{2}$ %. What per cent does he receive on the whole amount?

$$\frac{2}{7} + \frac{2}{5} = \frac{10 + 14}{35} = \frac{24}{35}. \quad \frac{35}{35} - \frac{24}{35} = \frac{11}{35}.$$

59. How many shares of stock must a man sell at $107\frac{1}{4}$, that when he invests the proceeds in 3% stock at $71\frac{1}{2}$ he may receive an annual income of \$900?

Each share of the 3% yields \$3 income.

\$900 income requires $\frac{900}{3}$ or 300 shares.

The cost of 300 shares at $71\frac{1}{2}$ is $300 \times \$71\frac{1}{2}$.

Therefore, the number of shares he must sell at $107\frac{1}{4}$ is

$$\frac{300 \times 71\frac{1}{2}}{107\frac{1}{4}} = \frac{100}{300} \times \frac{143}{2} \times \frac{4}{429} = 200. \quad \text{Ans.}$$

Therefore, he is entitled to keep the balance (\$500) $\frac{3000}{500}$ mo. = 6 mo. after its maturity.

Hence, the balance is due in 10 mo. *Ans.*

9. A man, Feb. 11, 1898, gave a note for \$1700 payable in 4 mo.; but he paid Mar. 22, \$400, Apr. 20, \$220, May 10, \$300. When was the balance due?

Note was due June 11, 1898.

$$\begin{array}{r}
 \$400 \times 81 = \$32400 \\
 \$220 \times 52 = 11440 \\
 \$300 \times 32 = 9600 \\
 \hline
 \$920 \qquad \qquad \$53440
 \end{array}$$

Therefore, he is entitled to keep the balance (\$780) $\frac{11440}{780}$ dy. = 69 dy. after its maturity.

Hence, the balance was due 69 dy. after June 11, 1898; that is, Aug. 19, 1898. *Ans.*

10. A man, Jan. 4, 1898, gave a note for \$2500 payable in 6 mo.; but he paid Feb. 4, \$200, Mar. 4, \$400, Apr. 4, \$600, May 4, \$500, and June 4, \$300. When was the balance due?

Note was due July 4, 1898.

$$\begin{array}{r}
 \$200 \times 5 = \$1000 \\
 \$400 \times 4 = 1600 \\
 \$600 \times 3 = 1800 \\
 \$500 \times 2 = 1000 \\
 \$300 \times 1 = 300 \\
 \hline
 \$2000 \qquad \qquad \$5700
 \end{array}$$

Therefore, he is entitled to keep the balance (\$500) $\frac{1700}{500}$ mo. = 11.4 mo. after its maturity.

Hence, the balance was due 11.4 mo. = 11 mo. 12 dy. after July 4, 1898; that is, June 16, 1899. *Ans.*

Exercise 136. Page 302.

1. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| | Dr. | | Cr. | |
|----------------------|-------|--|-----|-----------------------|
| May 17, 1897 | \$950 | | | Apr. 12, 1897 |
| | | | | \$1000 |

The difference between the equated times is 35 dy.

The balance of account is \$1000 - \$950 = \$50.

If the account were settled at the later date, May 17, 1897, the \$1000 would have been on interest 35 dy., which is equivalent to having the balance, \$50, on interest $\frac{1000}{50}$ of 35 dy. = 700 dy.

Hence, the balance should begin to draw interest 700 dy. before May 17, 1897; that is, June 17, 1895. *Ans.*

2. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| Dr. | | Cr. | |
|-----------------------|--------|----------------------|---------|
| Apr. 12, 1897 | \$ 950 | May 17, 1897 | \$ 1000 |

The difference between the equated times is 35 dy.

The balance of account is \$ 1000 — \$ 950 = \$ 50.

If the account were settled at the later date, May 17, 1897, the \$ 950 would have been on interest 35 dy., which is equivalent to having the balance, \$ 50, on interest $\frac{2\frac{1}{2}}{50}$ of 35 dy. = 665 dy.

Hence, the balance should remain unpaid 665 dy. after May 17, 1897 ; that is, until Mar. 13, 1899. *Ans.*

3. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| Dr. | | Cr. | |
|----------------------|---------|-----------------------|--------|
| May 30, 1898 | \$ 1000 | June 23, 1898 | \$ 920 |

The difference between the equated times is 24 dy.

The balance of account is \$ 1000 — \$ 920 = \$ 80.

If the account were settled at the later date, June 23, 1898, the \$ 1000 would have been on interest 24 dy., which is equivalent to having the balance, \$ 80, on interest $\frac{1\frac{1}{2}}{80}$ of 24 dy. = 300 dy.

Hence, the balance should begin to draw interest 300 dy. before June 23, 1898 ; that is, Aug. 27, 1897. *Ans.*

4. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| Dr. | | Cr. | |
|----------------------|--------|-----------------------|--------|
| July 6, 1897 | \$ 500 | Apr. 14, 1897 | \$ 480 |

The difference between the equated times is 83 dy.

The balance of account is \$ 500 — \$ 480 = \$ 20.

If the account were settled at the later date, July 6, 1897, the \$ 480 would have been on interest 83 dy., which is equivalent to having the balance, \$ 20, on interest $\frac{4\frac{1}{2}}{20}$ of 83 dy. = 1992 dy.

Hence, the balance should remain unpaid 1992 dy. after July 6, 1897 ; that is, until Dec. 20, 1902. *Ans.*

5. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| | Dr. | | Cr. |
|-----------------------|--------|--|-------------------------------|
| Aug. 13, 1897 | \$ 875 | | Sept. 13, 1897 \$ 600 |

The difference between the equated times is 31 dy.

The balance of account is $\$875 - \$600 = \$275$.

If the account were settled at the later date, Sept. 13, 1897, the \$875 would have been on interest 31 dy., which is equivalent to having the balance, \$275, on interest $\frac{4}{7}\frac{1}{2}$ of 31 dy. = 99 dy.

Hence, the balance should begin to draw interest 99 dy. before Sept. 13, 1897; that is, June 6, 1897. *Ans.*

6. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| | Dr. | | Cr. | |
|----------------------|--------|--|----------------------|--------|
| May 28, 1898 | \$ 500 | | June 4, 1898 | \$ 550 |

The difference between the equated times is 7 dy.

The balance of account is $\$550 - \$500 = \$50$.

If the account were settled at the later date, June 4, 1898, the \$500 would have been on interest 7 dy., which is equivalent to having the balance, \$50, on interest $\frac{2}{3}$ of 7 dy. = 70 dy.

Hence, the balance should remain unpaid 70 dy. after June 4, 1898; that is, until Aug. 13, 1898. *Ans.*

7. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| | Dr. | | Cr. | |
|----------------------|--------|--|----------------------|--------|
| Apr. 4, 1898 | \$ 400 | | June 6, 1898 | \$ 300 |

The difference between the equated times is 63 dy.

The balance of account is $\$400 - \$300 = \$100$.

If the account were settled at the later date, June 6, 1898, the \$400 would have been on interest 63 dy., which is equivalent to having the balance, \$100, on interest $1\frac{2}{3}$ of 63 dy. = 252 dy.

Hence, the balance should begin to draw interest 252 dy. before June 6, 1898; that is, Sept. 27, 1897. *Ans.*

8. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| | Dr. | | | | Cr. |
|-----------------------|--------|--|----------------------|--|--------|
| Mar. 12, 1898 | \$ 750 | | Feb. 4, 1898 | | \$ 500 |

The difference between the equated times is 36 dy.
The balance of account is \$ 750 - \$ 500 = \$ 250.

If the account were settled at the later date, Mar. 12, 1898, the \$ 500 would have been on interest 36 dy., which is equivalent to having the balance, \$ 250, on interest $\frac{4}{5}\%$ of 36 dy. = 72 dy.

Hence, the balance should remain unpaid 72 dy. after Mar. 12, 1898; that is, until May 23, 1898. *Ans.*

9. Find the time for the payment of the balance of an account if the debit and credit sides, when equated, stand

| | Dr. | | | | Cr. |
|----------------------|--------|--|-----------------------|--|--------|
| Feb. 4, 1898 | \$ 750 | | Mar. 12, 1898 | | \$ 500 |

The difference between the equated times is 36 dy.
The balance of account is \$ 750 - \$ 500 = \$ 250.

If the account were settled at the later date, Mar. 12, 1898, the \$ 750 would have been on interest 36 dy., which is equivalent to having the balance, \$ 250, on interest $\frac{7}{5}\%$ of 36 dy. = 108 dy.

Hence, the balance should begin to draw interest 108 dy. before Mar. 12, 1898; that is, Nov. 24, 1897. *Ans.*

Exercise 137. Page 303.

1. Find the cash balance of the following account, reckoning interest at 6%:

| 1897. | Dr. | Int. | 1897. | Cr. | Int. |
|-------------------------|-------------------|----------------|------------------------|-------------------|----------------|
| Apr. 5. To mdse., | \$ 250.00 | \$ 8.18 | Apr. 20. By cash, | \$ 200.00 | \$ 2.00 |
| Apr. 27. To mdse., | 610.00 | 5.89 | Apr. 30. By cash, | 500.00 | 4.17 |

| | <u>\$ 1100.00</u> | <u>\$ 9.12</u> | | <u>\$ 1100.00</u> | <u>\$ 9.12</u> |

Hence, the cash balance is \$ 40.00 - \$ 1.95 = \$ 38.05. *Ans.*

2. Find the cash balance of the following account, reckoning interest at 6% :

| 1897. | Dr. | INT. | 1897. | Cr. | INT. |
|--------------------------|-----------|----------|-------------------------|-----------|----------|
| Jan. 15. To mdse. 8 mo., | \$ 250.00 | \$ 7.46 | Apr. 26. By cash, | \$ 150.00 | \$ 4.20 |
| Feb. 25. To mdse. 8 mo., | 98.50 | 2.28 | May 17. By cash, | 150.00 | 8.68 |
| Mar. 8. To mdse. 8 mo., | 800.00 | 6.25 | July 7. By cash, | 200.00 | 8.20 |

| | | | Oct. 11. By bal. int., | | 4.91 |
| | \$ 648.50 | \$ 15.99 | | \$ 648.50 | \$ 15.99 |

Hence, the cash balance is \$ 148.50 + \$ 4.91 = \$ 153.41. *Ans.*

3. Find the cash balance of the following account, reckoning interest at 6% :

| 1897. | Dr. | INT. | 1897. | Cr. | INT. |
|--------------------------|-----------|---------|------------------------|-----------|---------|
| Jan. 2. To mdse. 60 dy., | \$ 100.00 | \$ 2.58 | Feb. 25. By cash, | \$ 100.00 | \$ 2.68 |
| Mar. 8. To mdse. 60 dy., | 200.00 | 2.90 | Mar. 22. By cash, | 150.00 | 8.88 |
| May 10. To mdse. 80 dy., | 150.00 | 1.85 | June 21. By cash, | 200.00 | 1.40 |
| June 2. To mdse., | 95.00 | 0.97 | Aug. 2. By bal. acct., | 95.00 | |
| | | | Aug. 2. By bal. int., | | 0.89 |
| | \$ 545.00 | \$ 7.75 | | \$ 545.00 | \$ 7.75 |

Hence, the cash balance is \$ 95.00 + \$ 0.39 = \$ 95.39. *Ans.*

15. If the height and the diameter of a cylinder are both doubled, in what ratio is the volume altered?

Volume = height \times 0.7854 \times diameter \times diameter.

(Of the larger cylinder the volume = twice the height \times 0.7854 \times twice the diameter \times twice the diameter.

Therefore, the larger cylinder is 8 times the smaller.

To borrow $\text{\$ } 2000$, the shareholder must own 10 shares; and he pays monthly $\text{\$ } 10 + \text{\$ } 12$, or $\text{\$ } 22$, for 10 yr., that is 120 mo.

The rate of interest is 5% yearly or $\frac{5}{12}\%$ monthly.

$$\log 22 = 1.3424$$

$$\log 64.4 = 1.8089$$

$$\text{colog } 5 = 9.3010 - 10$$

Hence, the cost of borrowing \$ 2000 from the coöperative bank is \$ 3400.

$$\log 2000 = 3.3010$$

$$\log 1.05^{10} = 0.2120$$

Hence, the cost of borrowing \$ 2000 at compound interest is \$ 3258.

43. A and B can do a piece of work in $13\frac{1}{2}$ days; A and C in $10\frac{3}{4}$ days; A, B, and C in $7\frac{1}{2}$ days. In how many days can A do the work alone?

If A and B can do the work in $13\frac{1}{2}$ days, in 1 day they can do $\frac{1}{13\frac{1}{2}} = \frac{2}{27}$ of it.

If A and C can do the work in $10\frac{3}{4}$ days, in 1 day they can do $\frac{1}{10\frac{3}{4}} = \frac{4}{43}$ of it.

If A, B, and C can do the work in $7\frac{1}{2}$ days, in 1 day they can do $\frac{1}{7\frac{1}{2}} = \frac{2}{15}$ of it.

Hence, in 1 day B can do $\frac{2}{27} - \frac{4}{43} = \frac{19}{1161}$ of the work.

Hence, in 1 day A can do $\frac{4}{43} - \frac{19}{1161} = \frac{17}{1161}$ of the work.

102. In what time will an empty cistern be filled by three pipes whose diameters are $\frac{1}{2}$ in., $\frac{3}{4}$ in., and 1 in., if the largest alone would fill it in 40 min. ? The rates of flow are proportional to the squares of the diameters.

The smallest alone would fill it in $(\frac{1}{2})^2$ of 40 min. = 160 min.

The other alone would fill it in $(\frac{3}{4})^2$ of 40 min. = $71\frac{1}{2}$ min.

Hence, in 1 min. the largest fills $\frac{1}{40}$ of the cistern,

the smallest fills $\frac{1}{160}$ of the cistern,

the other fills $\frac{2}{840}$ of the cistern,

and all three together fill $\frac{1}{40} + \frac{1}{160} + \frac{2}{840} = \frac{22}{440}$ of it.

Hence, it will take $\frac{440}{22}$ min. = $22\frac{2}{9}$ min. *Ans.*

103. How many gallons of water are contained in a length of 50 yd. of a canal, if its width at the top is 8 yd. and at the bottom 7 yd., and its depth 5 ft. ?

In still water the man could row $1.2 \times 4 \text{ mi.} = 4.8 \text{ mi.}$ in 1 hr. 12 min. Hence, the stream carries him down 0.8 mi. in 1.2 hr., or flows at the rate of $\frac{0.8}{1.2} \text{ mi.} = \frac{2}{3} \text{ mi.}$ per hour. When he rows with the stream he will row $4\frac{2}{3} \text{ mi.}$ per hour, and will row 4 mi. in $\frac{4}{4\frac{2}{3}} \text{ hr.} = \frac{3}{4} \text{ hr.} = 51\frac{1}{4} \text{ min.}$ *Ans.*

240. Red iron-rust consists of 70% iron and 30% oxygen. Find its formula.

$$Fe = 56 \text{ and } O = 16. \quad 56 : 16 = 7 : 2. \quad 70 : 30 = 7 : 3.$$

First seek multiples of 56 and 16 in the ratio of 70 to 30; that is, of 7 to 3. $\therefore Fe : O = 2 : 3.$

$$\text{Formula} = Fe_2O_3. \text{ Ans.}$$

241. The choking vapor of burning sulphur is sulphur and oxygen in equal parts. Find its formula.

$$S = 32. \qquad O = 16. \qquad O_2 = 32.$$

Formula = SO_2 . *Ans.*

242. Copperas is 28.9 % sulphuric acid, 25.7 % oxide of iron, 45.4 % water. Find its formula.

Water being 18, oxide of iron 72, and sulphuric acid 80, first seek multiples of 72 and 80, in the ratio of 25.7 to 28.9; that is, of 0.8893 to 1. But 72 and 80 are in almost exactly that ratio. This gives $FeSO_4$ + water; and it remains to find a multiple of 18 which is to 152 as 45.4 is to 54.6; that is, which is 0.8315 of 152, or 126.4. But $7 \times 18 = 126$; and the addition of 7 parts of water gives as the complete formula, $FeSO_4 + 7 H_2O$. *Ans.*

243. Spirits of turpentine is 11.76 % hydrogen and 88.24 % carbon. Find its formula. What per cent of oxygen combined with spirits of turpentine are required to make camphor, $C_{10}H_{16}O$?

Hydrogen being 1 and carbon 12, and 88.24 being almost exactly 7.5 times 11.76, we seek the smallest multiple of 12 that is 7.5 times a whole number. This is evidently 5 times 12, equal to 7.5 times 8. Therefore the formula is C_5H_8 , or as chemistry gives it $C_{10}H_{16}$. *Ans.*

Add O, and we have $C_{10}H_{16}O$, the formula of camphor; containing $\frac{16}{136} = 11.76\%$ of oxygen added to spirits of turpentine. *Ans.*

244. If the resistance of 1 mile of wire 2^{mm} in diameter is 4.72 ohms, what is the resistance of 3 miles of wire of the same material 3^{mm} in diameter?

$$1 : 7$$

$$1 : 5 :: 6.8 \text{ ohms} : \text{resistance.}$$

$$\left(\frac{1}{16}\right)^2 : \left(\frac{1}{4}\right)^2$$

$$\begin{aligned} \text{Resistance} &= \frac{7 \times 5 \times \frac{1}{16} \times \frac{1}{16} \times 6.8 \text{ ohms}}{\frac{1}{16} \times \frac{1}{16}} = 7 \times 5 \times 4 \times 6.8 \text{ ohms} \\ &= 952 \text{ ohms. } \textit{Ans.} \end{aligned}$$

247. If 50 volts force 54.8 ampères of electrical current through a lamp, what is the resistance ?

$$\text{Ampères} = \frac{\text{volts}}{\text{ohms}}$$

$$54.8 = \frac{50}{\text{ohms}}$$

$$\text{Resistance} = \frac{50}{54.8} \text{ ohms} = 0.912 \text{ ohm. } \textit{Ans.}$$

$$\begin{array}{r} 0.912 \\ 548 \overline{)500.} \\ \underline{4932} \\ 680 \\ \underline{548} \\ 1320 \\ \underline{1096} \\ 224 \end{array}$$

$$10 = \frac{\text{volts}}{2.8}$$

$$\text{Voltage} = 10 \times 2.8 \text{ volts} = 28 \text{ volts. } \textit{Ans.}$$

249. Five arc lamps on a circuit have each a resistance of 2.35 ohms. The resistance of the wires is 1.2 ohms and of the dynamo is 0.75 ohm. What voltage is required to send a current of 15 ampères through the circuit ?

$$5 \times 2.35 \text{ ohms} = 11.75 \text{ ohms.}$$

$$\text{Total resistance} = 11.75 \text{ ohms} + 1.2 \text{ ohms} + 0.75 \text{ ohm} = 13.7 \text{ ohms.}$$

$$\text{Voltage} = 15 \times 13.7 \text{ volts} = 205.5 \text{ volts. } \textit{Ans.}$$

FIRST STEPS IN ALGEBRA

BY GEORGE A. WENTWORTH,
Author of Wentworth's Series of Mathematics.

12mo. Half leather. 184 pages. For introduction, 60 cents.

THIS book is written for pupils in the upper grades of grammar schools, and for the first years of the high school grades. The introduction of the simple elements of algebra into these grades will, it is thought, so stimulate the mental activity of the pupils that they will make considerable acquisitions in algebra without detriment to their progress in arithmetic, even if no more time is allowed for the two studies than is usually given in arithmetic alone.

The great danger in preparing an algebra for very young pupils is that the author, in endeavoring to smooth the path of the learner, will sacrifice much of the educational value of the study. To avoid this real and serious danger, and at the same time to gain the required simplicity, great care has been bestowed upon the explanations of the fundamental operations and rules, the model solutions of examples, the selection of easy examples for the pupils to solve, and the arrangement of topics.

There is a considerable number of problems given to study and solve. By this means the learner is led to exercise his reasoning faculty and to realize that the methods of algebra require a strictly logical process. These problems, however, are divided into classes, and a model solution of an example of each class is given as a guide to the solution of other examples of that class. Nearly all the problems are original and are made with special reference to pupils of grammar school age.
